The HW-29A used 8-MHz crystals for the transmitter, and multiplied the oscillator frequency by 6 (so that 8.333 MHz crystals transmitted on 50 MHz) -- the 8 MHz crystals were readily available surplus at that time. The earlier HW-29 which came out around 1960 used more-expensive _overtone_ crystals -- in which the crystal was actually made to operate at a multiple of it's basic frequency. Since the 8 MHz FT-243 crystals were so cheap, many, if not all, the HW-29s were modified to take them, and Heath quickly figured it out.

Heath produced a mod kit for the original HW-29, to add an 8 MHz oscillator. As I recall, it was built on a bracket mounted using the two holes on the front panel that originally held the plastic Heath logo.

I obtained a used Heath CB model similar to the Tener, and converted it to a Sixer. I home-brewed the 8 MHz oscillator.

This was back in the 60s when the band was wide open. I did not have the capability of measuring RF power, but would guess my makeshift version of the Sixer put out about one watt.

Is anyone willing to sell me an ART-13 5A RF ammeter?

I don't care whether the case is in bad shape or broken. The important is that the meter shows ohmic continuity.

Shipment to a US location can be arranged.

Its salutary for collectors of stuff to read about the Collyer brothers. A good account can be found at:

http://en.wikipedia.org/wiki/Collyer_brothers

Electrical noise is a PITA in spades, doubled.

Wow.
I can't top that. That was a bit of an amazing story though.
I have lot of turn of the century National Geographics but nowhere near
what they did. There are a lot of radio parts, lots of books, both mine
and my daughters. Probably half of what I have is of no value, but I do
have some vintage test equipment and some older radios of the tube type.

You might also ask the question on the National reflector on qth.com. You
need to go to qth.com to subscribe.

Sounds like a common problem on older RXs. Worked on a more recent NC-125
that was deaf on 15 and 10. A local uses a preselector/pre-amp
on his older gear.

Good luck.

=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D
The local oscillator operates on the low side of the signal frequency
on bands A and B and on the high side for the other bands.  Aligning
with the LO on the wrong side of the signal frequency will kill the
sensitivity.  You may want to check this out.

I am looking for two range multipliers for the GR 1800-A VTVM. They are models 1800-P2 and 1800-P3. I thought there was just a possibility that someone here might have one or the other and want to dispose of it.

Isn't there a swap meet at the Sussex County (Augusta) Fairgrounds in
early July? Anyone have a link or information as to the date this
year? It has been several years since I was able to attend, but this
year I would like to see all the folks again. Any information would be
greatly appreciated.
rgds,
Mark S.

Hi Tony,

I believe these are available from a I.C.P., a French surplus dealer.

Check out their pages, available in french only unfortunately:

http://www.icp-fr.com/z_4647/index.asp?id=840&page=2&fond=

Hope this helps.

Thierry

Thierry, tnx for info, though I am unable to open that page.

Maybe it is just temporarily down. Will try later.

OT. Nothing to do with < rec.radio.amateur.boatanchors > and while it
says 'international' wonder what they know, if anything about UK or
Canadian Tax law??????? So suppose you have a Euro national living and
working in a Gulf state for a Canadian
```

corporation .... !
It is also pretty 'cheap' to advertise in a discussion group and does
not inspire any confidence whatever!

Hi Tony,

I had checked the link just before to send the message here and it
worked fine.

Now it's also down at the moment for me... Hope they'll come back online
soon!

Thierry

If anyone is parting out a B@W 5100 transmitter, I
am looking for a good front panel with no paint damage.

pete

5100. I believe the B version will fit, and that it only has an extral panel hole for the SSB selector switch. I could live with that, especially since I may add a 51-S adapter in the future.

Pete

If I can get an inside table, these items will be going to the July
11th Hamfest in Augusta: A Hallicrafters SX11 with matching speaker, A
gorgeous Hallicrafters SX28A, An excellent Hallicrafters PM23 speaker,
A Silvertone Tombstone, A Uniden Bearcat DX1000, A Philco 38-10, etc,
etc etc..... All work just fine and look great. Hope to see old
friends there.
rgds,
Mark S.

Hi,

Replaced all the caps some were off by 50% !!! Has a problem with the
readout, hoping it's not the transfomers.
I've pulled and checked all of the semiconductors on the power board so
there's a good chance I will have to live without the readout.

I finally have a piece of Heathkit gear that has proper fiberglass boards
instead of phenolic.

Any help appreciated. Pls forward off list.

Thanks

Ray

Hi,

The link works using Internet Explorer 6, but no joy with Mozilla
or with Opera.

Nice looking receiver.

73,
Ed

Greetings. This should initiate a bevy of responses :=). Since I have used Viking IIs in the past only for CW, and am in the process of getting back on AM with one of these when it gets here, what are the preferences out there for a mic for one of these. I can firstly assume a Hi Z non amplified type like an D-104, but I imagine there is a wide range of experienced users out there. Thanks kindly for your time.

Wayne (VE6NE)

I have a non-working Lampkin type 107c communications monitor. Does anyone know where I can find either a manual or schematic for it?
Thanks in advance for any assistance.

There was a very large variety of microphones which would work with this transmitter, any high-impedance mic will do. There are still some made but I am not current on what is available. Solid state stuff can used low or medium impedance mics directly but old vacuum tube TX need a matching transformer for them.

The main manufacturers of high impedance mics for public address or ham radio use were Electro-Voice, Shure Brothers, Astatic, and Turner. In addition American Microphone made a line but were a smaller company.

Crystal mics are vulnerable to heat, humidity, and mechanical shock so old ones are often not working. Moving coil, so-called dyamic mics, are very rugged and generally will work as well as when new if they have not been damaged in some way. Crystal mics were popular because they had very high output and were cheap. The D-104 was one of the first, if not actually the first, crystal mic on the market and has remained popular ever since. The early ones came with a choce of flat or rising frequency response but the rising response version was so much more popular that the flat version was discontinued. At least part of the sound is the result of the fairly large baffle area of the case. This causes a diffraction effect which increases the high-frequency output and makes the mic slightly directional at speech frequencies, both desireable for communication purposes.

I think its possible to get new elements for old D-104s but I would check first, they may be expensive since the D-104 has become a collector's item.

Google seems to have been dead in the water for many functions the other day. I had Google Patents go out on me, I think around 1 AM PDST. It came back later but was out for some time.

jack,

Try W7FG Vintage Manuals. They just changed the name but I feel sure W7FG
will get to their web page. Another is Pete Wa2CWA, the manualman.
If Pete does not have it he may know where to get the material.
73 Dave K4JRB

It looks like when you clicked it it did not include the last part of
the url on the second line. You may have to copy and past the whole
thing (be sure it ends in .htm) into your URL bar on explorer.

D-104C had a "ceramic" crystal element which was far more tolerant of moisture, shock, etc.
I can't remember just now what the frequency response was (compared to the original) but when
I used one, I was looked down upon as a traitor to tradition.
What was good about the D-104 types, was that you didn't have to speak directly into it. One
could just walk around the shack, and in some instances, around the house with little loss of
readability.

Old Chief Lynn, W7LTQ

Astatic and others made ceramic versions of their crystal mics. The ceramic was, as you say, much more rugged, but... It was less sensitive, according to a 1952 Astatic catalogue sheet the difference was 10db! The D-104 was rated at -45db, the D-104C at -55db. The reference is not given but I think its db below 1 volt per dyne. The D-104 crystal had one of the highest outputs of any crystal mic of the time.

There was the same difference in phonograph pickups, ceramic was more rugged and had good frequency response but significantly lower output. In the days when amplification was expensive the difference was important.

You can no longer get either the original crystal element or the ceramic element, but Astatic will sell you a dynamic replacement.

The dynamic is a whole lot smoother and less brittle sounding, but maybe that's a bad thing in a pileup.

They were very, very omnidirectional compared other communications mikes back then. The good part of this was the effect you note. The bad part is that noise sources like fans and people yelling in the background were also very readable on the air.

I am currently using an old Turner microphone and like the way it sounds.
Also I am a fan of some of the older EV desk microphones, which still turn
up cheaply at hamfests.   If you find a low-Z mike that you like, there is
no reason you can't just stick a step-up transformer in the base to drive
the Viking.

How do these sound compared to the dynamic equivalent of the D-104, the
10-DA (also known as the bullet head because of the space for the internal
transformer)?

Geoff.

There aren't many polar patterns published for cheaper mics but the directional properties of mics like the D-104 are mostly due to the diffraction around the body. At low frequencies they are almost perfectly omnidirectional but at some frequency begin to have some directionality which increases with frequency. The same diffraction effect causes a rise in the frequency response unless its compensated in some way. At a frequency where the path around the body approximates a half wave length the microphone can approach a super-carioide pattern, i.e., unidirectional with one or more lobes toward the back. The shape is important, a flat pancake shape like the D-104 will have a somewhat different pattern than a bullet-shaped mic. The ultimate was the Western Electric 630A "Eight-Ball". The spherical shape made it quite omnidirectional to rather high frequencies but the pattern was made even more uniform by the partial baffle mounted in front of the diaphragm. Metro-Goldwyn-Mayer made some microphones using probably standard Western Electric condenser elements mounted in a spherical case to reduce the diffraction rise typical of the older mics. I don't remember whether these had baffles on them but the elements were mounted in a way that also tended to reduce the cavity resonance typical of both this and other large condenser type elements. In some respects the rise was useful in dialogue recording although it could also make some voices sound harsh. All sorts of mechanical filters and baffles were tried to aleviate this effect, mostly with limited success. Electrical filters, which would have been a better solution, while known in the telephone industry, were not very well known outside of it. Much of the early theory of electrical wave filters was developed by George A. Campbell, of Bell Labs, in the mid 'teens. This was cosidered very advanced stuff at the time.

I am not surprized that no one makes crystal or ceramic elements any more. For the most part microphones to fill similar applications now are electrets.

Model 252.  Low-Z version of the 250 with the lift switch (which I strongly
discourage the use of).  If you were using a Viking II you would probably want
the 250 or to use a step-up transformer.

Actually, there are a few companies making ceramic elements for military
applications. They can stand abuse that would kill even the Gentex military
electrets.

My one and only Turner mic is a 999, a low impedance dynamic. I came into a windfall of good impedance matching transformers (UTC 01 Ouncers) so matching is no problem. Its a decent mic but may not be representative since I had to remove a dent from the diaphragm. This can be done with sticky tape and great care. The mic sounds good, less rise in the high end than my Electro-Voice 635. I think this is probably the original sound.

Turner seems to be the only one of the original big four makers of PA mics that did not survive. Astatic, Electro-Voice, and Shure Brothers all managed to navigate the vicissitudes of life.

American Microphone was another company who did not survive. Their last line of mics was a valiant attempt to break into the high quality broadcast and recording market but their technology left a lot to be desired. I have a couple of their high-end cardioid mics.

A friend had a recording made on his Ampex part of which was done with an experimental American pressure mic intended for high quality recording and another section with a "Telefunken" mic, actually a Scheops 201-M. No comparison, the American mic made all the instruments sound like they were made of paper boxes. The Schoeps mic is the one that actually established Telefunken's reputation and is the mic used for the Mercury Records "Living Presence" series.

The cardioid used a ribbon element with a dynamic just under it. It has decent patterns in one plane going horizontally around the mic but, of course, there is no match whatsoever in the vertical plane and very poor directivity. Actually, Brush made a similar microphone in the mid or late 1930s, essentially an RCA Junior Velocity mic with a Brush crystal element fixed to the top of the ribbon and facing up. I suspect it had much the same problems. Brush used a rather complicated network to match the two sections. I don't think they made these for long.

Hi,

You can install a Kobitone crystal element in the D-104 mic head,
Mouser.com P/N 25LM022
It has a raising freq characteristic similar to the old Astatic crystal element.

Electric Radio Magazine, Jan 2010, had the how-to-do-it article.

I found this doing a Google search. They appear to be available in several sizes and types and the company also makes ceramic elements. I found prices varied by a 2:1 ratio depending on who was offering them. Mouser had about the lowest prices, only about $5 US each. I suspect these will fit a lot of old crystal mics and make them useable again.

Are they any good? I remember American Microphone trying really hard to sell into the broadcast market with really cool-looking handheld omni

mikes. The chief engineer of the radio station I worked for dismissed
them all as "crap that's designed to look nice on TV."

Actually, the WE 639 (later the Altec 639) used the same arrangement.
It could be a figure-8, an omni, or a cardioid, but it only sounded
even remotely decent as a figure-8 because the dynamic was just so awful.

I thought all the Living Presence recordings were done with Telefunken
condenser mikes?

It seems that many microphones designed for communication purposes had/have a haystack in the articulation range, i.e., rising above about 500 hz and peaking around 3 to 5 K. As you probably know most of the energy in the human voice is below about 500hz but the frequencies that contribute to articulation are around 1k to 3k. Good articulation can be had even if no frequencies below about 1500hz are included but naturalness requires some of the lower frequencies.

The 639 dynamic element is the same as used in the 630A "Eight-Ball" and 633A/B "Saltshaker". The diaphragms were hard to make. They were annealed to get the hard spots out. John Frayne told me that there was more than a 50% rejection rate. Good ones sound decent many were not so good. Altec was not as careful as WE even though they had to meet WE specs. Doc Frayne told me that WE lost money on every 639 they made. It was a prestige item.

The 639 was arranged with the moving coil element facing front where the American Mic had the element under the ribbon facing up. This makes sense if one thinks about the pattern in the horizontal plane only. The problem is that the moving coil mic is not truely omnidirectional due to the diffraction effects of the microphone case so there is no match or a very poor match in the vertical plane. The 639 actually has reasonably good discrimination in both planes because the directionality at high frequencies depends on diffraction effects rather than the phasing of the two elements, the ribbon is rolled off above about 3Khz. The 639 is a bit of a kluge but a very cleverly worked out one. BTW, the Marshall and Harry patent shows the moving coil element mounted _on top) of the ribbon, but facing forward. I think the revesed arrangement on the production mics was done for appearance. The case was a Raymond Lowey design and I think the mounting was compromised for appearance.

The 630A was also expensive to make because it was complex. The case has two parts with a baffle and acoustical resistance between them. The 633 was an attempt to make a cheaper version.

Altec made some plastic diaphragm versions of the same capsule which were also used for small tweeters. I don't know how they sounded in comparison to the metal diaphragm version.

In general, I don't like moving coil microphones for high fidelity applications. They alsways sound mushy to me. They are eminently suitable for communications purposes because they are extremely rugged and can be made to have high output. Most moving coil mics rely on some sort of resonator at the high end to keep the response up. The 630A, which was thoroughly described in a paper in the Bell System Technical Journal, has a cavity resonator plus a capacitive resonator below the diaphragm. All these resonators combine to produce a very sharp cut-off at the high end and typically result in poor transient responce.

The American mics do not sound very good because the moving coil elements are not very good. Again, metal diaphragms and rather poor transient response. The omnidirectional mic showed up on some of the local TV station, I remember seeing them on KTTV, but were no competition to Elecro-Voice who used molded plastic diaphragms and had pretty smooth response. I think American tried hard but simply did not have the technology to compete. The cardioid mics are also adjustable pattern, they have a board with jumpers under the label. I don't know a lot about the history of the company. I think I did read something or hear somethign about them long ago but its faded away.

There were two other small microphone manufacturers in the Los Angeles area in the 1930s and 1940s, they were Universal Microphone Co, in Culver City and Carrier Microphone Co. I beleive Carrier was the superintendent of Universal. I am not sure of American Microphone personel had any relation to these companies but think they might have. American was in East LA at first but moved to Pasadena.

Telefunken never built any microphones but acted as the marketing agency for both Neumann and Schoeps. I think they even marketed some AKG mics at one time. While Neumann mics, particularly the U-47 became famous under the Telefunken name the Mercury Living Presence series was apparently made using the Schoeps 201-M, a dual capsule cardioid/variable pattern mic. They are shown in some publicity photos of the sessions. Mercury used a single-mic pickup, somewhat unusual for American recording at the time. They also used modified Fairchild cutterheads. Mercury was one of the first recording companies to adopt hot stylus (orinated at Columbia) and variable pitch. The pitch variation was done by hand by the recording engineer following a marked up score. Not sure when the first automatic groove pitch machines came out but it must not have been much later.

Meissner (SP ?) wrote a letter to Audio Engineering magazine after an article describing the Columbia Hot Stylus technique was published claiming he had developed a similar system in the late 1920s or early 1930s which he attempted to use at Brunswick. The management thought the resulting records looked funny and did not ever use it in practice. Hot stylus makes a lot of difference in both noise and in high frequency response where the original is made on laquer, perhaps less on wax but I am not certain of that.

Hi

By "lift switch" do you mean the switch contacts to complete the circuit
to the mic element? Or did that mic include a switch
on the bottom, so that when you pick it up, you transmit?

It's a switch on the bottom so you transmit when you pick up the mike.  There
is a locking switch that disables it, but the locking switch sometimes gets
dislodged when the mike is knocked over.

The time has come for me to add a sweep generator to my bench and I am looking for recommendations. I would like to keep the cost as low as possible yet have something that would be functional for what I do, which is largely repairing receivers that operate between 500 kHz to 30 mHz. There are tons of them for sale but wading through the multitude of brands and models is somewhat daunting.

Hewlett-Packard never made a bad piece of test equipment that wasn't a scope.

Just stay away from Eico and Heathkit and you'll be fine. There is a
Nida 444 on Ebay for $9.99 right now with only a few hours left.

Hi, Gang

Pete Millett has recently moved to a new hosting site, and expanded
his collection of old electronics textbooks available for download.
The new site is here:
http://www.tubebooks.org/technical_books_online.htm

One very good book is the GE Sideband Handbook,
a compilation of all the SSB info appearing
in the GE "Ham News". Included is the GE "SSB, Jr."
the forerunner of the Central Electronics 10A.

Pete's site can be rather slow, so I moved a copy of the GE SSB Manual
to Rapidshare, since it is a large file (151MB):
http://rapidshare.com/files/372823457/GE_Sideband_Handbook_1961.pdf

73,
Ed Knobloch

I'll grab it, but does it have much on DSB? GE seemed to be the proponent for DSBsc (versus Collins and SSB), and Webb who wrote an article about DSBsc and then a construction article about making a synchronous detector (about 1957 in "CQ"), I thought he worked for GE. They were talking about full blown DSB with proper detectors, to do away with the carrier but make use of the benefits of two sidebands. DSB is covered in the other SSB books, but there it's an intermediate step, simpler to build than an SSB transmitter but simpler and better than an AM transmitter, but one was expected to receive it with an SSB receiver which turned the DSB signal into an SSB signal before the product detector.

Hi,

Yes, the book has two DSB transmitters featured, the "DSB, Jr."
an 80m QRP rig with a pair of 6AQ5's in the balanced mixer final,
and a 200W input bandswitching DSB rig using a pair of 6146's.

For SSB receiving, they have a 12 tube phasing IF adapter
(quite advanced for 1948), or the simpler "slicer" adapters
later commercialized by Central Electronics.
The book doesn't include the synchronous DSB adapter
printed in a late 1950's CQ magazine.

73,
Ed Knobloch

I just want to point out here that the one, most amazing and wonderful
thing that Mr. Millett has done has been to not only scan and make available
the always-rare RCA HB-3 tube handbook, but also to cross-index it so that
individual tube data sheets could be found quickly online.

The HB-3 manual is the one that was sold to engineers designing equipment,
as opposed to the RC manuals sold to servicepeople or available at your
local electronics parts place. It contains all the curves for everything
RCA made and it is just a tremendous and wonderful resource. I cannot thank
Mr. Millett enough for making this available.

I say that even having obtained a paper copy of the whole manual... the online
version is just faster to find material in.

Thanks Richard and everyone else here. (For some reason my email wasn
=B4t "beeped" when these responses came so I am a bit behind and have
some heavy reading to do here, but seems to be a wealth of important
info here that i have to digest, then start the search engines to find
an appropriate mic(s). Most Vikings I have seen have a D-104 with
them but the specifics as to their innards of course is a guess.
Thanks again and best 73s for now. Guess I better keep checking back
here from time to time. 73s,
Wayne

That's an interesting comment. I was reading a biography of Art Collins
recently and it mentions his efforts to get SSB into the Air Force, and
that it was in competition with G.E. wanting to push DSB.

One of the famous papers on this topic is "Poisson, Shannon and
the Radio Amateur" by John Costas in Proceedings of the I.R.E., December
1959, p. 2058. Costas covers a lot of ground in this paper, but a couple
of the points in favor of DSB are that you can recover the carrier
precisely from the signal, rather than having a local oscillator that
is approximately the correct frequency of the carrier. And that you
add the energy from the two sidebands coherently, so that just as
Shannon proposes you gain SNR by occupying more bandwidth. I guess the
attraction of SSB was that you get twice as many channels in the same
piece of spectrum as you do with DSB. And having an approximately correct
carrier frequency is good enough for most purposes, and is not hard to
achieve. Also Art Collins may have had better connections with his
friendship with Curtis LeMay and Butch Griswold. He participated in the
famous flying demonstrations of the capabilities of SSB. So far as I
know G.E. didn't get to do the same thing with DSB.

At any rate, Costas was one of G.E.s wise men.

I don't think he has the complete HB-3 yet, still a work in progress. Pete's site is amazing and wonderful, much extremely valuable stuff some quite rare. The scans are supberb, a superlative I rarely use. Fortunately, I have access to a very high speed connection and have downloaded nearly everything he has on the site. The new site is easier to navigate than the original one, which BTW still exists and has a lot of audio stuff on it. Fans of McIntosh amps and other equipment should take note because he has many McIntosh insruction manuals and service notes there.

Thanks Richard and everyone else here. (For some reason my email wasn�t "beeped" when these responses came so I am a bit behind and have some heavy reading to do here, but seems to be a wealth of important info here that i have to digest, then start the search engines to find an appropriate mic(s). Most Vikings I have seen have a D-104 with them but the specifics as to their innards of course is a guess.
Thanks again and best 73s for now. Guess I better keep checking back here from time to time. 73s,
Wayne

As mentioned before while the D-104 was an excellent mic for ham use it was not the only one. _Any_ high impedance mic will work with the Viking, most have enough output. For good speech intelegibility in the presense of noise its desirable to favor the upper-mid frequencies, i.e., from about 1000 to 3000 hz since that is where the energy that carries the inteligence is. Most of the power is below 1000 hz, so a system with a cut off of around 300 hz and rising characteristic will put more of the modulation power in the range necessary for understandability. However, for naturalness you need some lows. Bell Labs, in their research for minimum bandwidths for telephone service found that inteligibility needs frequencies up to about 2800 hz but that, on the low end, it was found that voices were unnatural sounding unless the low end was extended to 250 or 300 hz. The phone company adopted a channel bandwidth of 2500 hz extending from 250hz to 2750hz. In fact, a wider bandwidth will sound better. On a noise-free channel wide-band, uncompressed speech has the best intelligibility but in the presense of noise band limited speech with spectrum shaping (fancy for rising frequency response) and compression or clipping, is more inteligible. A paper by Licklidder et.al, published in the _Journal of the Acoustical Society of America_ about 1948 reported experiments with _infinite_ speech clipping. Licklidder found that if speech was put through a differentiator (6db per octave high pass RC network) infinitely clipped (NO amplitude variations at all left) and then integrated (6db per octave RC low pass filter) the intelligibility was perserved and improved where the speech was competing with noise. In a quiet channel the unprocessed speech was better but the clipped speech still has something like an 80% articulation score. When in a very noisey channel the clipped speech maintained its score where untreated speech fell off severely.

Lots of mics, both old and new, will work this this transmitter.

Mil surplus 3" dia. 115 VAC 400 Hz.equipment cooling fan. Made by IMC
Magnetics Corp. model IMCool 300. Speed is 13,000 rpm, 0.23 A current.
More available, all tested. See link below. I have at leat 20 even though
only one is listed on the site.

<http://us.ebid.net/for-sale/3-equipment-cooling-fan-115vac-400hz-
26065253.htm>

Be sure you get the whole link and it ends in .htm in your browser. I've
had problems with the end (on the 2nd line) being cut off when people click
it.

Hi, Gang

I stumbled upon web site with info about replacing
the bipolar transistor amplifier in the base of some D-104 mics
with a JFET amplifier for improved performance.

http://www.ko4bb.com/Manuals/08%29_Misc_Ham_Equipment/
Improving_the_D-104_N9WB_rev2.pdf

73,
Ed Knobloch

Well, the reason why there were different innards, and the reason why
there are so many different mikes in general, is because there are lots
of applications.

A taxi dispatcher in a noisy garage is probably going to want a very
different mike than an airport radio operator in a quiet tower who wants
to talk some distance from the mike.

There are hams out there who seem obsessed with trying to sound like Gary Owens. There are some who seem obsessed with getting the most natural voice sound. There are others who seem obsessed with getting the most voice intelligibility at the costs of natural sound. And others just want to sound different so they stand out in a pileup. Pick any one you want, there's a microphone for it.

Can someone tell me approximately what the AGC voltage (first and second RF amps) and AVC voltage (first IF) should be for, say, a S-9 signal level? I need some benchmark information that I can compare my receiver voltages to.

Thank you in advance for any help you can give me.

Searching the web I was unable to find a diagram for adding an S-meter to the
BC-312 and BC-348.

Clearly I could try typical S-meter circuits, but I wish to keep the receiver as
original as possible, and I would then prefer to directly build  a proven
circuit.

The circuit should have a fairly simple interface with the receiver, so that the
meter can be easily put externally,

Thanks and 73

My first serious receiver was a BC-312.... 1952 I think.  Except for
the lack of band-spread it's a great receiver.  Here is a link to a
circuit for adding an S-meter.  I don't recall how I modified mine,
but this looks good.

Don ex KL7BCQ and W7SAT

Thanks for info. It looks fairly simple and implies a fairly simple and
restorable modification.

I must check whether the same circuit can be used for the BC-348 too.

Thanks & 73

=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D=3D
That is a good suggestion.  I ended up putting a 6SB7Y in the local
oscillator position in my SX-28 to get reliable operation on band 6
(21-43 Mc.).  It doesn't hurt to use a 6SB7Y in the mixer position
either.  Even with that, the sensitivity on band 6 is not up to the
lower bands.  --Ed

Talking of dogbones, I am looking fora couple of those Pyrex glass aerial
insulators of the 1940-1960 era. Not the big ones but the ones about 100 mm
long. Anyone got a couple?

Looks good, but would look even better if the photos on the site were in

```
proportion. Could that be fixed?

They're too expensive!  Use a glass cutter to cut the end off a soda bottle
and use the glass loop as your insulator!

Checked this evening and you are about 35 years too late. what I do
have are way different values. Lone meter is too small.

Now, if you need some 1206 smt resistors or capacitors, I have dozens
of reels.

Paul, KD7HB

I have an excellent condition Drake r8B FS its been boxed for the last 5
years. I did test on the service monitor and used it for a week to check it
out. performs as new. I am the original owner and bought it from Universal
back when they announced they were going to D/c the units.
I had a spinner knob put on it. That's the only mod Universal put the VHF
unit in it for me.
$1500 plus shipping
Doug N2PLR

Actually its a rehash of an earlier project that didn't live up to expectations.

Pic at: http://www.sparkbench.com/xmtr030510-2.jpg

Its kind of tacked together as a 'prototype' in the photo. Now that I've got it fairly well tweaked out its time to rebuild it properly and replace the new parts with some OLD parts :) Dropped a large dime at PTOP today.

6AG7 VFO!!!, 42 Buffer/Doubler, 807 PA. 0D3 regulator. Showing about 15 watts out on 40 with a clean enough signal to put on the air.

Lovely stuff!  But what is the cloth in the backgound for? To keep the
valves warm and thus enhance frequency stability? :)

Hi guys,

Just thought I'd share a story. I've had the little NC-88 running fine for a while now and decided its time for alignment. Everything went smoothly until I hit Band D.

Band D uses low-side injection and by following the instructions it tuned up just as it should. Dial readout was right on the money, counter confirmed the LO frequency was correct. However, I was getting strongest reception on the image. Went back and forth a few times. The range of the L and C really won't allow you to tune it to the other side.

Then I noticed the Antenna trim control was fully open when peaking the correct signal. It was in the 'authority' range of peaking on the upper image and thats why it seemed to be better there. So I spread the turns on the antenna coil as much as I could and that brought it into range of the Ant trimmer adjustment.

Peaks like it should now and actually has some image REJECTION on Band D. I like simple fixes although it took me a while to ascertain if I was doing something stoopid like before :)

-Bill WX4A/KP4

I could also use a manual for the Knight R-195 should you find one.
Will be happy to pay copy/mail costs.

Thanks,

I have observed (while monitoring mixer output with an oscilloscope
during rf alignment) that the output of the mixer is, at zero beat,
about one half of what it is a few KC away from zero beat on all
bands. I have successfully performed IF and BFO alignment several
times (with the same result each time) and the natural crystal
frequency is 455.9 KC.

To me this suggests that the mixer is putting out a signal that is
different than the IF frequency, and thus I am losing some
sensitivity.

Can anyone suggest if and how I should adjust the local oscillator so
as to get maximum signal strength from the mixer at the IF frequency?

I'm not quite sure what you are looking at and what you mean by zero beat. Normally, to set up an IF with a crystal filter the test signal, whether at IF frequency or an RF signal, is adjusted to be right on the crystal frequency. This can be done using the BFO but not to get zero beat but to get the maximum output at some convenient audio frequency. Once this is established the IF transformers are adjusted for maximum output. Most receivers are set up using a modulated signal with an audio frequency well within the pass band of the IF, say 400hz. The IF is adjusted with the AVC off and the RF or IF level at a minimum so that the RF gain can stay high. The reason for this is that some IF and RF stages suffer from some detuning as the AVC voltage is increased. You want maximum selectivity for weak signals so they should be set up with a weak signal.

I prefer to set up IFs using an RF signal rather than direct injection to the mixer because I've found that direct injection can sometimes detune the stage a little.

I have Burroughs Giant nixies type B7971 used in early stock exchanges. These come in a 17 pin socket with some hardware and transiostor drivers but they can be bypassed to light the tubes. They give an alpha-numeric display and are somewhat of a novelty. I have five of them with mounting boards. $8 each plus postage from Ottawa ON.

Hi, Hank

I don't have an SX-28, but have done a similar alignment
with an HRO-50. One key thing is to find the "natural crystal
frequency" with the phasing capacitor set to half mesh.
You need to eyeball that capacitor, in case someone slipped
the phasing capacitor knob zero setting over the years.
If necessary, mechanically adjust the phasing control knob
to zero with phasing capacitor at half-mesh.
Then align the BFO coil for the same frequency, with the BFO
capacitor set to half mesh. If necessary,
mechanically adjust the BFO knob
so the BFO knob reads zero with that half-mesh
BFO capacitor setting.

Then use that frequency to align the IF transformers.
On my HRO-50, I wound up with a 457 KHz IF
center frequency.

73,
Ed Knobloch

Beautiful home-brew amplifier. Pair of 4CX250B's. Floor mounted PS. Plate voltage 1650. 500W out on SSB peaks. Running in class AB1. Weight 50lbs, PS about 65lbs. No shipping, can be picked up in NH, or will meet within a reasonable distance.

All wiring using Teflon coated wire or Belden Hi V rubber insulated. Chassis and cabinet are made from heavy 1/8th inch thick aluminum plate. All cut and filed by hand. All bolts/nuts for chassis and cabinet are stainless steel. Uses full wave bridge circuitry in HI V with K2AW's "Silicon Alley" rectifiers. Step-start circuitry in both HI V supply and amp. New Dayton blower installed last Summer.

PLEASE NOTE: For photos ONLY, contact me at w1cny@comcast.net

For delivery information and operating questions, please contact the owner, Norm,
WR1W at newoodnh@ne.rr.com

In my SX-115, putting the selectivity switch to the widest position (5KHz):

- I see a two S-units drop in the S-meter reading
- selectivity is actually narrower than in the 3 kHz position.

I wonder whether SX-115 owners have same or similar experience.

Looking at the schematic diagram, there are five switch wafers that determine selectivity, two of which switch capacitors and three switch resistors. I have determined that the switch works fine, so I am wondering whether the problem could be due to a mistuning of the 50 kHz IF coils.

Thanks for any advice.

<snip>

Hi, Tony

I also realigned my SX-115. Results were excellent on cw and SSB
bandwidths, but the a.m. wide response was disappointing.
There was some very noticeable sensitivity loss in a.m. wide,
but I don't remember it being so much (maybe 1 S/unit).
My receiver is in storage, so I can't check easily.
I thought my problem was the T-notch filter still being
within the a.m. bandwidth. There is no on/off switch for the T-notch,
you just shift it away from where you are listening when not in use.

Ed,

yes, paying more attention I realized that, in the 5kHz position, bandwidth is actually nearly twice the bandwidth in the 3 kHz position, but .... there is a notch just in the middle, despite the notch knob is positioned at OFF (I know that notch cannot be excluded, but just moved in frequency...).

The consequence was that, at 5 kHz selectivity, I experienced the very strange effect to hear the same AM station at two distinct frequencies, a few kHz apart from each other.

But then, moving the notch knob, such "doubling" effect disappeared and I could hear the AM station just at a single frequency, though with a much higher bandwidth.

In conclusion, I had to put the notch knob at the other extreme with respect to the OFF position, and the problem seems to no longer exist.

Thanks & 73

Tony I0JX

BTW: yes, the signal drop is closer to one S units than to two

Ah, very good info, thanks, Tony.

I will try shifting the SX-115 notch to the other extreme
when in a.m.

I have no idea why this link does not work.  If you want some photos
just write me and I'll upload them to you.

Hi, Phil,
Looked at the construction - very neat.  But the "reflex port" looks
very large and has no extension tube.  I'm wondering how it can be
resonant with the free-air speaker resonance (but no calculations
done, just a gut feeling.) I don't doubt the originality of the design
but it might sound even better with no port at all.
Cheers,
Roger

Yah, don't ask me -- I'm just the messenger :-)

Perhaps others know more about the state of audio design in 1940 and what "bass reflex" may have meant at the time.

I believe the cabinet has a solid back, by the way, although the photos don't show it.

Phil Nelson

An earlier poster asked for info about the ADF-T12C. I have the Indicator head (Motorola Servo Amp Indicator 551A). Can someone give me the pin out for the connectors to this indicator? Many thanks!

Seems a little silly to have to advertise for one of these but I need a 5 inch round 4 ohm PM speaker for a restoration of my Hallicrafters S-72. Anyone have one in good condition for sale? Not looking to shake anyone down for a freebee...I prefer to pay my own fare.

Ahhh for the good old days when old metal cabinet TV sets could always be found in alleys waiting for the trash man...or enthusiastic radio guys harvesting parts.

Smokey

Try your local Quam-Nichols dealer... they still make all the same drivers they made in the 1950s and they still work just as well. My local outfit is Cain Electronics in Hampton, VA.

The parts are different today, but new CRT TV sets are being pitched
right and left and they have some pretty nifty stuff inside.

Looking for a CW Pitch knob for a Hallicrafters SX-71. I believe the same knob was used on the SX-42, SX-43 and possibly other models of Hallicrafters receivers from the late '40s and early '50s era. Attached is a couple of pictures of what I'm looking for. Please note that this knob has a pin on the back that allows for only one rotation of the knob.

Thanks,

Brian - W8KHZ

A word of caution to anyone considering this: when starting this
procedure, fill the container only a third of the way with MEK. All
that polystyrene needed to thicken it up to honey-like consistency will
increase the volume a lot.

I have a half-pint mason jar that started with a third of MEK. I fed it
one and a half letter-sized inch-thick slabs of foam and it's still not
done.

Phil,

Are you the person to whom I sent some dimensions of the R-12, a year or so ago?

Hi Jim:

I have "complete instructions for operation of the signal calibrator model 9-1006" This version has a 50 kc and 10 kc multivibrator (6N7s) and 1852s in the output stage. Your calibrator is different - unless you copied the number wrong. Let me know if this will help

I started with about half the jar filled with MEK. Since I used styrofoam the displacement of the material before it dissolves is much greater than after because so much of it is air. The first pieces dissolved very quickly, in fact it looked like Alka-Seltzer dissolving. Toward the end it took a few minutes for each additional piece to dissolve. The total amount is amazing until you remember that its mostly air. After the first flurry of very quick solution I added pieces about twice a day and just let it alone between times. Of course with the cap on, MEK will evaporate very quickly.

I'm working on an NC-88 and a couple things aren't sitting right with me.

1. Overall 'oomph' seems to be missing. It receives well enough but even benchside listening requires that the volume be up to about 75%. Doesn't seem right. An AA5 would blow it away. Finger on the volume pot wiper gives a very healthy hum so the problem must be further back.

2. BFO. Works but is really weak. I tried more coupling but no increase. The Sensitivity control has to be almost at the floor to hear it. Its really too weak to be functional.

Recapped, many resistors found out of tolerance, voltage checks are all ok. Some previous owner had the IFs badly mistuned. Found an intermittent factory joint on the bandswitch.

I guess what I'm asking are these 'features' typical of the NC-88? I wouldn't think so. Maybe the two symptoms are related?

Thanks for any comments.

I don't have a clue, but before SSB (and I can't remember whether this receiver predates it, it likely doesn't matter for this purpose when it came out), BFOs were relatively weak. Their purpose wasn't to provide a good mixing action, just a beat note.

Which is why there were all those articles about turning down the RF gain when receiving SSB on such receivers. I'm sure a lot had terribly weak BFOs even then. And given that the same general design in general coverage receivers carried over into the age of SSB, the age of the receiver may not be that important.

There may be an issue, but perhaps your expectations are higher than the design had in mind.

All of this points to something in the detector/avc/noise limiter area. Have you made tube socket resistance measurements and voltage measurements? Those may show something up. When doing extensive recapping there is always the chance of getting something in wrong or one of the new caps being bad.

While the BFO voltage is generally low in conventional receivers its not _that_ low and should give a strong beat note with the RF gain in normal position although it will no be linear enough for SSB.

I stirred mine with a screwdriver and finished it in a couple nights.
Watching the first few chunks dissolve was rather amusing.

I don't know what sort of lid you used on the jar, but MEK softened up
the sealing compound. Based on what I found on a website on what sort
of gloves to use with MEK, I think butyl rubber caulk would be good to
keep the solvent from seeping out. Dissolve off the rest of the sealing
compound, then apply the caulk in its place. While you're waiting for
the caulk to cure, some foil on the jar should keep the MEK in place.
Or, even better, prepare the lid before mixing up the dope.

I don't have any schematics yet, BUT for those following the discussion
about kids' walkie-talkies, the 1968 edition of the Mobile Manual has
on pp. 218-219 a schematic of the three-transistor Knight C-100 CB
Transceiver and directions on modifying it for 6M AM. Worth checking
out although the modulation level on this design doesn't look like
anything to write home about.

A big ole DUH for me. ANL switch was open in either position. Amazing any audio got through at all.

Sounds pretty normal now.

Aren't you supposed to add an audio transformer to improve modulation?
I seem to recall reading something along those lines in one of the
magazines.

Contratulations!!! Its so easy to overlook obvious
things. It can be very helpful to have someone else look at
a thing you have been busting your head over. The NC-88 is a
neat little receiver.

Yeah, I had to step away from it for it to become obvious.

I've had a fun time tuning around with it. I bought the thing on a
nostalgic bent and its nice to cruise around on a relatively simple old
tube receiver. Most of my SWLing in recent years has been solid-state
and homebrew stuff. Thats fun too but its just not the same :)

73,
Bill

Hi, I am a radio-ham
I have a surplus Codan 9360 with his automatic antenna and find someone that can give me an answer to the following question :
* it is a way to open the TX frequency setup and store and display the frequency in TX mode?.(may be replacing the original SW or adding a supplementary RAM).

Today in "free receiver" position I tune my RX frequency (...7050,00 KHz...), I tuch one time "Emergency Call" in the control panel and then use the microphone to transmit, but I can't see the transmission frequency.
Really I see the previous channel frequency (may be 6250 KHz...or other...) that haven't effect during transmission and reception after the above setup...
If I turn the Select knob or press the Mode button all TRX is reset to previous channel mode and frequency...and I can repeat the procedure to set my TX frequency or I loose it.
At disposal for moredetails.
All yours suggestions will be appreciated.
'73
regards
Stevez

Not auction...

Clean for its age. looks non-smoking.

Pictures: (click on image for big image...)

http://dyb.com/radios/radios/1.html

http://dyb.com/radios/radios/2.html

http://dyb.com/radios/radios/3.html

details:

HEATHKIT SB-110A S/N:28839

HEATHKIT HP-23

Radio checks out at 96 watts out in tune, 102watts peak SSB

Aligned calibrator

Adjusted bias, ALC, S-Meter

LSB carried osc is flaky, and does not work most of the time, LSB is almost never used on 6 meters. Tapping on the crystal seems to bring it back.

Receiver hears .1uV.

PTT is odd, unless rig is in VOX mode. Might be V5B 6AZ8, Relay amplifier.

Surplus Sales of Nebraska has more 11 pin sockets/recepticals for the power connector.

All controls and switches need cleaning.

Included is CDROM with manual copy of rig and most of the available power supplies.

HP-23 needs (and is) to be set to the lower voltage. (rotary switch on side of supply)

Power supply was brought up slowly with variac. (unit sat for a few years. Ran it four hours after bringing it back up)

$325 plus shipping from 78701

Paypal. Money order, cash if picked up.

Domestic/USA sales only.

My WJ 8618B will save all settings....freq, BW, etc when power is turned OFF and then back ON again. I also have a WJ 8617A that does not save the settings. When it is turned OFF and then ON again the settings return to 20mhz AM setting. Can I get this radio to retain stored settings when powered OFF and then back ON again?

Thx

Actually, I am not sure what the lid and gasket are made of. This was a jar I bought at a local chemical supply house that is now out of business (and sorely missed). I tested both the cap and gasket with MEK before using the jar, they seemed to be immune to it. Your suggestion about using aluminum foil as a cap liner is a good one.

I just did a Google search for gloves suitable for use with MEK and found a chart showing a variety of chemicals and recommended gloves for use with them at:

http://msds.chem.ox.ac.uk/glovesbychemical.html

This lists teflon and butyl rubber as suitable for MEK.

I already am a member of Premium RX, but tnx for the reply. I figured the
radio had a backup battery, but couldn't find it. Found my answer on Premium
RX....installed missing battery and now all OK

Look at both radios and see if you can find a small battery (similar to
those on a PC's motherboard for instance). If so the one in the 8617A
is dead. A large capacitor could also hold enough juice for a few days
of memory, but this is less likely than a battery. If the 8617A has no
battery and the 8618B does, perhaps you could copy the battery
connections into the 8617A.

Squirrel cage type blower, still sealed in original foil wrap, military
surplus. It runs on 200 VAC, 3-phase 400 Hz, and at 6000 rpm.
Made by Western Gear Corp, Applied Technology Division.
Several available, see (updated) link below.

I think we've all had our DUH moments. Mine had to do with an HQ-145 which was given to me when I bought a Heath SB-200 from a ham who was selling the stuff on behalf of an estate from a deceased ham. He said it didn't work...and it didn't. I recapped it after an inital "smoke test" was positive. I also bough a 3rd part reproduction manual for it.

Several instances of cursory testing didn't improve matters and the receiver was set aside for other matters. Later when I noticed some minor varients between my receiver and the schematic, I downloaded another schematic and noted that this new schematic had a note on it that my orignal schematic did not have. The note said that you have to have either a send receive relay in place or you have to jumper the line cord socket on the back panel intended for the send-receive relay. Otherwise, the receiver will think it is set to be deadened for transmission. I quickly ginned up a jumper, plugged it in and of course the receiver worked perfectly. But talk about feeling dumb.

I think I lost the import of that connection in my tracing the circuit through some switching.

We all do it.

Hi, Jay
```

I have a B&W 380B electronic TR switch which looks as you describe. You use a series UHF coax T-Connector mounted on the "Antenna" terminal of the TR switch. One end of the T goes to the Transmitter, the other end to the antenna. The "Receiver" terminal gets a coax line right to the receiver.

It's also possible to use the TR switch between a separate receiver antenna and the receiver.

I have no paperwork. B&W advertised it as good for a KW A.M. on the HF bands.

The 380B uses a single tube, type 6AH6 pentode.
Mine required replacement of the two electrolytic capacitors in the power supply, and the 1K resistor from the power supply B+ to the tube.
The Selenium rectifier was OK.
There's a large bifilar choke under the chassis for the 6AH6 heater line, and a smaller ferrite rf transformer above the chassis feeding the receiver. The 6AH6 rf amplifier circuit is untuned. The 1.2 Meg grid resistor furnished cutoff bias when the transmitter is on.

Don't forget to use a low pass TVI filter between the TR switch and antenna.

The coax length between the TR switch and the transmitter should be as short as possible, to minimize "suck out" effects - possibly desensitizing the receiver at certain settings of the final pi network.

Also, the transmitter and/or amplifier should be biased to cutoff during receive, to minimize noise.

I added a fuse in the power cord - the unit was originally unfused.

73,
Ed Knobloch

I am restoring an old Hallicrafters SX-28 and have one remaining issue that I need to resolve -- poor sensitivity on the upper bands, which appears to be related to very poor signal transfer from the antenna to the grid of the first RF amplifier tube. IF stages appear to be functioning well. I have signal voltage readings (oscilloscope) for all of the inputs and outputs from the antenna to the output of the mixer, but have no baseline to which I can compare my readings.

If someone is familiar with the SX-28 and the relative signal intensities that I should be seeing at the various RF stages, please contact me via e-mail so that I can discuss this.

Thank you!!

Is the oscillator voltage holding up on the higher bands? Check the
self-generated oscillator tube grid bias voltage with a high-impedance, low capacitance probe to a VTVM or DMM on DC volts range.
Compare measurement to that on the lower bands.
Cheers,
Roger

Need some items for a project. Check your junkboxes!

1. Meter, 250ma, round black, 3-1/4 or 3-1/2 OD, similar to Weston 301, etc.

2. Qty 2 of 1000pf (.001) domino-type mica caps. Small, low voltage ones.

3. Asstd old style 'dogbone' type carbon resistors. Could use a couple each of 10k, 50k, 75k, 1 and/or 2 watters. Don't necessarily have to be exactly within tolerance. I have some wiggle room :)

4. Tappable ceramic wirewound bleeder resistor. 50 to 75k more or less, 20-25 watts.

Thanks in advance,

Bill WX4A

There are a number of rigs that measure cathode current rather than plate current. Depending upon the tube, screen current is only a small percentage of plate current, so even a 10% change in screen current may result in only in a 1 or 2% in cathode current.

I have one other bizarre thought - which I admit has not been given much thought - suppose you fed the screen with a constant current source, so that screen current would not change at resonance?

Also, off this subject and back to screen modulation techniques, the old
Radio Handbook mentions that many beam power tubes will self modulate, with
no additional screen audio supplied. Apparently, it can vary from tube to
tube. Despite that stateement, I know of many am transmitters using beam
plate final tubes that do have audio applied to the screen, so take the
statement with a grain of salt.

Hey if someone has an actual CRT bezel for a 3" tube that would be nice!
Is it a Millen or something war surplus? I don't need the tube,
actually I have a VERY nice 3ADP1 by Dumont. It's a weird bottle, the

front is not a cone shape but rather a cylinder that goes straight back for about 3" before it tapers all at once to a smaller cylinder holding the electron gun. The deflection plates and the second anode connect to pins sticking out of the tube neck. It has a standard 12 pin crt base (12 pin "octal"). It's a PDA type with the third anode connector in the usual place on the tube bulb. VERY high deflection sensitivity and probably good to over 100 MHZ. If anybody has ever seen the cover of the November/December 1975 73 magazine you know what I'm building!

I also have a 3ACP1 and a Millen shield that fits it, but the 3ADP1 is a better tube and I don't have a way to mount it (no shield I've ever seen that mounts to the panel will fit this tube!).

Can anyone tell me, when unlocking BANDSPREAD dial and turning the

BANDSPREAD knob fully clockwise, is the BANDSPREAD DIAL supposed to reach its turn limit on or near the red "ZERO" line or is it supposed to reach its limit on or near the low end of bandspread frequency arcs (coinciding with the logging scale number "100")? If you have an SX-42, does your BANDSPREAD track reasonably closely when placed on the ham band "dots" on the MAIN TUNING dial?

Thanks for the continued help with this project.

ci

> There are a number of rigs that measure cathode current rather than plate current. Depending upon the tube, screen current is only a small percentage of plate current, so even a 10% change in screen current may result in only in a 1 or 2% in cathode current.
> I have one other bizarre thought - which I admit has not been given much thought - suppose you fed the screen with a constant current source, so that screen current would not change at resonance?

That was the very initial question of my post. My concern was that tuning for the minimum cathode current may not be as sharp as tuning for the minimum plate current, because when plate current decreases the screen current increases (though only about 1/10 in magnitude). I am not feeding the screen through a resistor from the HV because I do not wish to add a clamp tube to avoid screen voltage rising too much in absence of drive. I am feeding it from a very stable low-voltage supply, so screen current will vary.

> Also, off this subject and back to screen modulation techniques, the old Radio Handbook mentions that many beam power tubes will self modulate, with no additional screen audio supplied. Apparently, it can vary from tube to tube.
> Despite that stateement, I know of many am transmitters using beam plate final tubes that do have audio applied to the screen, so take the statement with a grain of salt.

The self-modulation method is just the one I am using. I have a 20H choke on the screen path, and that will (I hope so!) self-modulate the screen. I plan to finish work in a month from now. At that time I will be able to report to which extent screen self-modulation works.

The bandspread dial should read ZERO when the bandspread capacitor is
at minimum capacity i.e., when the plates are in the un-meshed
position.  On my SX-42 the 20-meter band is right side of ZERO and the
remaining bands are on the left side of ZERO.  The minimum capacity
(un-meshed position) of the bandspread capacitor is in the middle of
its rotation range and the bandspread dial should read ZERO there.  --

I pulled up a PDF of the specs on the 3ADP1 and see the dia. is 3" +_
1/16, so unless you have measured the tube diameter to be exactly 3",
the meter housing will not work. The ID could be bored to 3",but not
any more. Besides, the tube may not be an exact cylinder and that is
probably why they have the +_ 1/16.

If you are familiar with the OS-8 surplus scope,that is what I have gathering dust. It has a pull-out light shield as part of the front bezel.

I am sure I have seen the 73 magazine issue, but that was back in 1975! Memory is not able to access a picture of the front cover.

You are welcome to the OS-8, if that will help.

73, Paul KD7HB

It was the last small issue, the second part was in the first larger size issue. It was a combined issue so they could get the larger format out before the competition, all the magazines switched over at the same time. The scope was on the cover, it kind of looked like a Tektronix 453? (it's wider than it is high), and if I recall properly, it had a built in battery so you could run it away from the power line. It was an impressive project, yet it was also limited, no really high frequency response.

John W. Campbell's solution about 15 years before in "CQ" was to do away with amplifiers and run the scope tube off a relatively low voltage, which gave them better sensitivity. Feed the signal right into the plates, you'd get a dim trace but great frequency response. He got the idea from Bell Labs.

Feed the signal right into the plates, you'd get a dim trace but great frequency response. He got the idea from Bell Labs.
>
> Michael VE2BVW
>

That's the scope. It did look like a tek 465/475 series that gotten shrunk down a bit (3" vs 5" tube). Actually the frequency response could have been as high as 50MHz with that circuit. As described the scope used transistors with an ft of 50MHz which got the scope to about 15-20MHz top end. The op amp used in the vertical preamp was good to about 90MHz. I corresponded with the author on some details and was told that he had later substituted transistors with higher ft (100MHz) and got 45MHz out of the vertical chain with some tweaking. He suspected it would go a bit higher by hand picking transistors / op amps. I have some 140MHz transistors I can use and have a bunch of op amps so I can hand pick those for best response. The 3ADP1 should in theory go higher in frequency than the 3ACP1 (and I have two of each).

I suppose that today most would consider a 50MHz scope as not being really HF, but that's about high enough for most work with 8 bit microcontrollers and HF radio gear. BTW, this scope DOES run at low voltage, +/- 600 volts on a PDA tube designed for +/- 2000. The author suggested a mod for dual trace and I even considered this, but running the tube at low voltage to get the deflection sensitivity and bandwidth would make a dual trace option too dim to see well.

Today the way to build a scope is with fast A/D converters and software. Digital scopes react to oversampling in a different way than analog scopes though. Instead of rounding off square waves and showing reduced amplitude they build false waveforms due to aliasing errors. (they lie).

I suppose I'm guilty of the worlds worst case of procrastination on a project with this one!

Depending on the choke inductance value and the final tube you may or
may not get full 100% modulation.  But it will be close enough for
government work and will sound just fine.

Ok, let's stop procrastinating and decide what you want to do about
the bezel for the tube! Do I put the meter back together or ship it?

For all you Boatanchor guys there are some really nice BAs
in the Ernie Hite collection that's going to be auctioned
at the Charlotte Antique Radio Conference coming up in March.
If you'll use this link,
```

http://charlottearc2010.homestead.com/Hite_Photos_Page_8.html
and scroll down toward to bottom of the page you find photos
of them, including an Al Parker restored SP-600. There's
a like there to Al's web page detailing the restoration of
this SP-600.

The show is just 65 days away.
Don't miss it.

Good stuff. But one photo is obviously phony!  The one with the morse key
and rats nest of wires in  it has a number of patch leads with aligator
clips of very modern manufacture just dumped onto it. That photo seems to
show rubbish!  The rest is lovely though...

Nothing "phony" about it.
It's an early spark transmitter that Ernie was in the process of
trying to get working. The clip leads and all are just how he left
it before he died.

Thanks for looking. Sounds like the meter case might be a tight fit and require more work than I thought. If a proper CRT bezel shows up that will fit I'll look at that. Meanwhile I seem to have found some scrap plastic thick enough to hold the front of the tube up if I can cut a 3" hole in it. I'll google the OS8 scope you said you had a bezel from and see if I can find a picture of it to tell if that might work.

What kind of tube is in that OS-8?
From this photo (http://www.stevenjohnson.com/pics/os8-02.jpg) the
shield looks like it would fit the 3ADP1 like a glove!
I don't see any connections through the neck to the plates though,
unless they are on the right side of the tube. Don't see the HV
connector to the anode either.
Maybe the scale of the photo is confusing me and that's really a 3RP1 in
there.

What do you want to know? Any old Handbook is likely to have a circuit
that can't be too different from a commercial product (they all have to
be about the same) and describe how to hook them up.

If you're looking for historical information about the specific device,
then I don't know. What's so puzzling about the unit that you need to
know?

I have the whole scope, including the base and locking cover. I will
look for it this evening and see if I can determine where the HV is
connected. Don't have a the manual.

Paul, KD7HB

Hi

I also have a DKC-TR, with no instructions.
It should be usable on 160 thru 10 meters.

The two SO-239 connectors that have continuity thru the center pins
are for antenna and TX connections (doesn't matter which is which).
The other SO-239 (at narrow end) goes to the RX.

The cable has a black lead to 6.3V, a red lead to approx 125 to 150 VDC,
and a shield to ground.

The tube used is a 6AH6 pentode.

You should include a low pass TVI filter between the TR switch
and your antenna.

The BAMA mirror site has instructions for the DowKey model TRM
TR switch, which includes general TR switch usage guidance,
but is a different design, using a dual triode tube type 12AZ7.
Keep the cable length between the TX and the TR switch as short
as possible, to avoid "suck out" effects on RX sensitivity.

Also, the TR switch should be used with a class C final, or one
which has cutoff bias applied to the finals during key-up, to avoid
increased white noise in the rcvr.

73,
Ed Knobloch

Let'see what will happen. By the way, also the T-368 adopts the self-modulation method. As a matter of fact the screen resistor is connected to the cold side of the modulation transformer.

A possibility is that, due to a failure affecting the receiver circuitry somewhere, your receiver has become extremely deaf on band 3 and up, so that even the strongest signals do not move the S-meter, though they can still be heard.

The fact that the S-meter gives a very slight negative indication may not mean much, as it could just be a consequence of the same failure that makes the receiver deaf on bands 3 and up.

You must exercise your judgement to determine whether on bands 3 and up the problem is just in the fact that the S-meter does not move or that the receiver instead becomes deaf. For this purpose, you could try to tune the same station on the highest part of band 2 and in lowest part of band 3 (the two bands will surely overlap somewhat) and, without looking to the S-meter, try to determine whether the receiver sensitivity looks similar.

The CRT in the OS-8 scope is a 3RP1 which has no external connections,
other than the 12 pin socket. The transformer windings show an AC of
455 volts to a 1/2 wave rectifier for the CRT HV supply. Don't know if
it's a voltage doubler or not. The winding is rated at 0.0005A, 1/2 a
mill amp. So, I doubt if that could stand up to the required inrush
current for a voltage doubler.

I plugged it in and turned it on and after waiting for the tubes to
heat, found a nice trace that was easily focused to a nice thin,
straight line.

So, I decided there is no reason to scrap it just for the shield and
bezel. Perhaps my Great Grandson will use it! One teenage grandson
that might use it is into airsoft and paintball guns!

I see a couple of full 3" shields on Ebay. One could punch a hole or
two or more for external connections.

Paul, KD7HB

Sounds like a nice scope.  A shield for the 3RP1 wouldn't fit the 3ADP1
anyway.  If nothing else there are some kits out there that will convert
a simple scope to a clock you might want to fool with.

Thanks everyone. I had found most of the references. The one piece of
information I did not have in hand was the wire color code. I used
this for years with an HQ-150, CE-20A plus the LA-1. The sheet on the
DKC-TRM did not satisfy my curiosity and my old handbooks are now in
storage.
Now that I have your attention, why is the tube type TR switch no
longer made or used? The idea seems great.
Regards, cullen

Very few people use separate receivers and transmitters.

Few are interested in the sort of break-in that you could get
from a TR switch, they can live with relay changeover.

Transceivers sometimes use the same thing, but it's done with=20
semiconductors not tubes.

Anyone around have such a radio? I have one that has been butchered and
I would really like to sit down with an operating one and compare some of
the supply wiring.

And you can make a pretty good one for not much money using PIN diodes.
The Handbook even used to have a design.

Some transmitters produce a strong signal into the antenna
in spot mode when an electronic TR switch is used.
I measured about 275mW out from my Ranger II on 40m in "tune" mode,
and 125mW out in "standby" "VFO Zero" position.

You might consider switching in a dummy load before VFO-swishing
the band.

73,
Ed Knobloch

My local ham store doesn't have a good selection of anything other than
sealed appliance transceivers.

There are tube type TR switches made for military applications, but for
the most part they are too slow for modern signalling methods which is
why the PIN diode units are such a big deal.

The fact that you aren't likely to find a T/R switch at your local ham store (if you happened to still have such a local store) is an indicator that they aren't used, because if there was demand surely there'd be a commercial product. One would also see the lack of separate receivers and transmitters, as I already mentioned, so one could gather there is less reason for such a device nowadays, and even fewer are using non-matched separates, so that S-line or the SB-line or whatever handles the switchover.

The fact that some still use them doesn't negate his statement. Surely it's only a relative handful, and they aren't visible enough. Enough time has passed since they were common that many hams likely don't even know what they are.

In the old days there were multiple reasons for using them, and they were often simpler than the alternatives. Nowadays, other things take care of the task, whether it's a current equivalent of the TR switch hidden away inside that transceiver or something else, so the only people using them are those who want to run an old type station, or have some specific use for it.

If he'd asked somewhere else, chances are good nobody would question his point about "nobody using them" since there is less likely to be users except by boatanchor types, and chances are good that if posted elsewhere someone would say "what's that?".

Michael VE2BVW

Anyone have use for these?   I have both RCA and GE NOS 6080 and 6AS7G
tubes.  Probably 10 NOS 6080 and 10 used,  5 6AS7G  and 3 6AS7GA all
NOS,  about 10 total 6080 used and 2 6AS7G used.
$7 for the NOS ones,  $5 for good used ones,  or make an offer
email me directly...
thanks

I am restoring a Hallicrafters SX-28A, and need to acquire a set of RF amplifier coils for that receiver. The original ones were ruined in a previous lifetime. If you have a set of RF coils, the coil / bandswitch module, or a parts chassis containing all of the oscillator / mixer / RF coil modules, please contact me.

I have just completed building a class-C AM transmitter with an 829B (two tetrodes in parallel) driven by a T-368 VFO.

The 829B bias is a fixed -33V (keeping the tube safe against lack of drive) plus the bias which develops across the grid resistor. It works fine, but I still have to adjust the grid resistor value for optimum performance

In the 829B data sheet I read a value of about 7 kohm. In my Geloso AM transmitter (single 6146) they use 12 kohm. In the T-368 (single 4-400A) they use about 23 kohm.

My practical experience is that lowering the grid resistor I always get more output power FOR THE SAME GRID CURRENT. In other words, every time I try a different resistor value I re-adjust the drive power so as to make the grid current equal to the allowable limit of 15 mA.

At the moment I ended up using just 470 ohm but, despite that value gives me good output power, I suspect that it may cause some drawbacks that I cannot presently figure out.

Does anyone have a CLEAR understanding of the trade-offs involved in selecting the grid bias resistor value? Or where I can find a practical and coincise discussion of the issue?

Thanks & 73

Tony I0JX

Does anybody have a schematic for this meter. I inherited one and it
has several plugin probes but not instructions as to what they are.
One probe has a tube built into it.

I cannot give you actual values for your set up, but basically, if you
have already provided optimum bias with your fixed bias voltage, then
you will not need to develop any more bias across a grid resistor.

peter

The higher the grid resistor, the higher the bias voltage that must be overcome by the drive. Hence, higher drive, more power lost in the grid resistor, and lower conduction angle.

So, too high a grid resistor and you'll need to beef up your drive stage. Plus (as mentioned), your conduction angle decreases, and your final-stage efficiency may suffer.

Get the grid resistor too low, your conduction angle will increase, and your final-stage efficiency may suffer.

Note that I say "may" -- there's an optimum conduction angle. There's handbook values for it (which I can't remember!) but I'll bet that no one amplifier works best right at the handbook value.

If you _really_ want to be scientific about it then for each grid resistance value monitor your final stage input power, the amplifier output power, and calculate the grid resistance dissipation. If nothing else, that'll help you make an informed choice.

Otherwise, if it's given, calculate the grid resistor value to get you both the desired current and the RF p-p voltage, or the rated bias voltage, whichever is listed for your tube in that service.

Hi Tony:

My 1936 Radio Handbook gives the following information:

"Grid-leak bias is quite flexible and more or less automatically adjusts itself with any variation in RF excitation. The value of grid-leak resistor is not particularly critical because the DC grid current usually decreases as the grid-leak resistance increases, theeby keeping the product of the two more or less constant for a given amount of RF excitation. Hence, the value of the grid-leak resistance can vary from one-half to two times the optimum value, a ration of four to one, without materially affecting the negative DC bias voltages actually applied to the grid of the amplifier tube.

One of the disadvantages of grid-leak bias is that the bias voltage is proportioonal to the RF excitation, thus precluding the use in grid modulated or linear amlifiers, whose bias must be supplied from a

well-regulated voltage source so that the bias voltage is independent of
grid current."

So, I guess the answer is "use whatever value that makes the tube happy".

73, Colin K7FM

Actually the value of the grid leak bias resistor used in a class C amplifier is going to be a function of the available peak RF voltage being supplied by the driver stage, and the required grid drive / bias voltage of the final. The maximum allowed grid current rating of the final tube must not be exceeded either. If you look at some classical ham transmitter circuits the grid resistor value varied quite a bit. For the 807 tube a typical value was 15k (as recommended by RCA) but where drive current was limited (such as on ten meters driven by a quadrupler from 40) a 22k or higher value was common.

My fixed bias is set for an idling plate current of 10 mA. The only criterion behind that bias setting was to keep the final tube safe. So, it may not be optimum with regard to the final stage efficiency.

On the contrary, it is surely not optimum because, without extra bias, the tube operates class B. More bias is needed (produced by the grid resistor) to have the tube operating class C.

With a fixed bias supply  , do  you  really  need a  grid  resistor as
such ? how is the  -Ve  bias reaching the  grid ? ....with the
cathode earthed .. the fixed bias is  'required'  .. I would think for
a  given drive  level ... increasing the  -Ve  grid bias would  reduce
the  conduction angle and slide the  stage  from class b to  c  as
the  peak drive level  would need  to  overcome the  bias to allow
the  grid to  conduct .. thus the  conduction angle is reduced ?

Yes, because the fixed bias I have chosen causes the tube to operate in class B, whilst I wish it to operate in class C.

how is the -Ve bias reaching the grid ? ....with the

I agree with your statements but they do not help me much with regard to my original doubts

The original data has guide lines on the vlaves use in class C telephony .....

http://www.r-type.org/pdfs/829b.pdf

I have several data sheets for the 828B of various manufacturers but with the grid resistor value they specify I obtain less output power than with a lower resistance value

>
> --
> www.wescottdesign.com

Thanks for your comments. I agree that there should be an optimum grid resistance value (even if rather dull), but in my case the optimum occurs at zero grid resistance.

Let me report you some tests I have made, increasing the grid resistance in steps (starting from R=0) and then re-adjusting the drive power each time (and also re-optimizing the Pi-network controls):

- increasing the grid resistance and then adjusting the drive power so as to keep the GRID current constant, the plate current - and hence the output power - decreases. Therefore, to obtain maximum output power, the grid resistance must be zero

- conversely, increasing the grid resistance and then adjusting the drive power so as to keep the PLATE current constant, the output power remains about the same for a quite wide range of grid resistance values (except when resistance becomes very high). It should be noted that, increasing the grid resistance at constant plate current, the grid current increases significantly, to the extent that, for fairly high grid resistance values, the grid current gets beyond the allowable limit.

In conclusion, it looks like the final stage operates best at zero grid resistance:

- no efficiency loss
- minimum grid current for a given ouptut power.

In such conditions, the tube operates in class B (the fixed -33V bias causes an idling plate current of about 10 mA), with a circulation angle of more than 180 degrees. Increasing the grid resistor causes a reduction of the circulation angle, with no practical benefit and some drawbacks.

Where has the class-C efficiency advantage gone?

Thanks both for the quote and the comments.

The advantage of class C isn't necessary greater efficiency. By
reducing the conduction angle the tube is drawing current for a short
period of time and therefor can run cooler. It also means that the tube
can be run at a bit higher power level than it could in class B since

the AVERAGE power dissipated is the same. HOWEVER the duty cycle of
both the time transmitting vs not transmitting and that of the signal
also play a role. In other words a class C CW transmitter in theory
could be run at higher power than a class C FM phone transmitter (even
though both are usually run at the same typical parameters) since the
tube can cool between elements on CW, while FM is key down forever.
Also class B audio has a different duty cycle than a class B RF linear
amplifier running FM (don't need to be linear for FM 'thou).

In the 30's there was an article in QST on how someone ran a 200 watt
tube at a KW CW. It worked because of CW's short duty cycle, but the
editor suspected 'short dashes'.

Im still confused as to the role the grid resistor is playing in
the amplifier, if the bias is generated by a power-supply , then any
change to the psu output voltage would be resisted by the psu ...
assuming the feed is via a choke ?
where is the grid resistor .. from the grid to real earth ..or
in series with the power supply ??

Convention was to feed via a low value resistor / rfc or both
with a medium value bleed to earth in the 1 K range

Liner service then requiring the psu to resist voltage
fluctuation under drive variation and as such required a low Z path
to the valve and the ability to dissipate voltage .ie gas

discharge tube or dc feed back loop ... zener diode

I have the feeling this is a driver / pa grid matching problem ?

G ..

I cannot quite follow your reasoning. The tube temperature is bound to the dissipated power. And the dissipated power simply is the difference between the average DC power and the RF output power (neglecting losses in the Pi network).

So, if varying the signal duty cycles and tube conduction angle, I anyway read the same output power and the same DC power, the stage efficiency is the same.

That's OK.

Im still confused as to the role the grid resistor is playing in the amplifier, if the bias is generated by a power-supply , then any change to the psu output voltage would be resisted by the psu ... assuming the feed is via a choke ?

Yes, the bias supply is a zener-stabilized -33V supply. I have verified that the supply voltage stays constant independently of grid current.

where is the grid resistor .. from the grid to real earth ..or in series with the power supply ??

The grid resistor (and a low-resistance RF choke) are both in series with the bias supply. So, for zero grid current (no excitation), the grid bias is just -33V (so keeping plate current at about 10 mA). When I apply RF drive, the bias grows up (sum of -33V and the voltage that develops across the grid resistor), so pushing the tube into class-C operation

Convention was to feed via a low value resistor / rfc or both with a medium value bleed to earth in the 1 K range

To obtain a total of -50V @ 12 mA grid current (class-C operating conditions recommended by the tube manufacturer), a grid resistance of about 1,400 ohm is needed (33 + 0.012 * 1400).

Liner service then requiring the psu to resist voltage fluctuation under drive variation and as such required a low Z path to the valve and the ability to dissipate voltage .ie gas discharge tube or dc feed back loop ... zener diode

I have the feeling this is a driver / pa grid matching problem ?

As I mentioned above the bias supply resists to grid current and its voltage is perfectly stable.

> sink current, or does its output voltage rise with grid current?

The bias supply is a zener-stabilized -33V supply. I have verified that the supply voltage stays constant independently of grid current. So the effective grid resistance coincides with the grid resistor.

Tubes don't self destruct in an instant when they are asked to dissipate
more than their max rated power. So long as the AVERAGE dissipated
power over time does not exceed the max rating things are safe. The
duty cycle will change the average power dissipation. Also the
temperature isn't bound instantly to the instantaneous power dissipation
due the the tubes' thermal mass.

Yes, Ohm's law is OK, but the my issue was that whatever "desired grid bias" I take, the final stage efficiency does not change, So, changing the grid resistor makes almost no difference, whilst I would have expected that biasing the tube in the class-C region would yield more RF power that when it operates in class B (i.e. with grid resistor = 0 ohm)

My practical experience is that lowering the grid resistor I always
get more
output power FOR THE SAME GRID CURRENT.

So ... how do  you  know its the  same ...if you  use a  meter ..
then the  shape  factor  of the grid pulse will change the  meter
reading .. wider pulse lower peak  will  still  give the  same
reading ?

need  to  check the  waveform  .. not easey ..  simple  way is to
forget the  resistor  and provide a  variable  bias psu . and  inject
via a  low  ohm  rf-choke ... and add some link to the  bias voltage
and the  pa plate  supply ..no bias  no supply  .. simple  relay ?

get more
output power FOR THE SAME GRID CURRENT.

Same experience here.

So ... how do you know its the same ...if you use a meter ..
then the shape factor of the grid pulse will change the meter
reading .. wider pulse lower peak will still give the same
reading ?

need to check the waveform .. not easey .. simple way is to
forget the resistor and provide a variable bias psu . and inject
via a low ohm rf-choke ... and add some link to the bias voltage
and the pa plate supply ..no bias no supply .. simple relay ?

What is commonly called "grid current" is not the instantaneous grid current, but its average value (i,e, its DC component). So, when one measures the grid current using a DC meter, he has not to worry about the actual current waveform.

I try to explain me better. When I change the grid resistor, I see no chage in the ratio between RF output power and DC input power, this meaning that efficiency does not change, I would have exprrcted that, going class-C, I would have got a higher efficiency (more RF power, or lower DC power, or both).

The screen grid is fed by a dedicated 200V supply, which is very stable (within the screen current excursion).

tari!

Your  not  supposed to  ask  questions like that Eddi  !

My  point with the  grid  supply  wave form , is that the  point of
conduction is  set by the  voltage .. so  depending on th  voltage the
sinusodial drive  waveform will redue to a  pulse  train .same peak ..
but  lower  average ... I think  there  is some  form  of operation in
the  'negative' region .. now if the  screen  is  dropper fed, then
its floating and may be subject to  secondary emission .. so  the
working  point  of the  valve is moving ... may be  not if the  screen
is  stabllised .. but if so  . would than not  affect the  am mode ?

G ..

hi
anyone have info about a monarch tube stereo? SMX-52AC.

was monarch similar to other japanese companies such as pioneer?

thanks
louis

You might do better to ask in rec.antiques.radio+phono.

>was monarch similar to other japanese companies such as pioneer?
```

Monarch was an actual manufacturing company in Japan, and a lot of their equipment was sold in the US under various house brands. They were smaller than the big guys, but they started in the big Japanese electronics boom in the early sixties and lasted at least until the late 1970s.

They didn't made a lot of different receiver models but they made some guitar amps and pedals as well. I don't know your model, but their tube receivers were typical Lafayette-grade equipment... undersized output transformers and undersized power supplies.

There may be a Sam's on your unit. Sam's listed some of the Monarch stuff.
That's the first place I would look.

I guess this weekends Aurora Repeater Association Hamfest in Brighton Co was a success for me. I brought home a few items. I didn't find the tubes I was looking for, but did find a 7094 at a fair price even if it is dead.

But the two big items needed work. One, A Meissner 9-1076 Calibrator, (100 kc frequency standard), had been mostly recapped, it just needed new filter caps. Unfortunately neither it nor the HP-312 Frequency Selective Voltmeter (a DC to 18 Mhz receiver with a highly accurate signal strength meter) work. As usual neither came with a manual.

They both are boatanchors. The Meissner Calibrator in age and the
HP-312 in weight.

I am in need of manuals for both. That Surplus dealer in Nebraska has
a manual, but it costs more than twice what the calibrator cost me and
the HP-312 isn't even on the Agilent site or any other I could find.

So I am asking for help. Does anyone have either of these manuals? I'd
like to scan the HP-312 manual and send it to the Agilent old manual
site for others to use as well as use it myself.

312-what? The letter suffix is often needed for HP equipment. Is it a

312A, B, C or D? Also, the serial number is often needed to provide
the correct manual (or change sheets) for a particular instrument.

I have a scan of the 312B/D manual for serials above 312-B-1534A00401
and 312-D-1523A00101, including changes for later serials.

t/starcity/starcity.html

Well, a deep subject, and so is this unit. The Front panel says 312A
but the missing (never installed)serial number plate may have implied
something different. That coupled with the unlabeled external 1 Mhz
reference connector and reference selector switch, on the rear panel,
the never installed input probe and left hand input BNC connector, and
the LED display suggests that what I have is an engineering prototype.
The 312 series was apparently designed and built in the HP Loveland
plant, it would seem to be a good explanation of what I have given
where I bought it.

The 312B/D Manual is available on BAMA. So I will try and use that to
get this unit receiving.

Thats for all the info I received on and off this group.

Jim

Well Still looking ......Just a  little more informed .!.

Any of the  series , TCS-12 TCS-13 TCS-14 (the later the  better ?)

Manufacture , labes , original power unit ,  cables , that sort of
things , not too high on the list !

Tops is the   TSC  Transmitter ... power  plug would be handy ...
hacked well depends if 'thay' used a new blade,

Just needs to  have 'all the big bits' , nice if its working ...

Can collect inside UK and poss Ireland , depands on the weight packed
~ fuel ~ etc surface mail , from outside uk possible ?

Tnx - G ..

You have a very interesting and valuable site, especially for those of us who like Hammarlund receivers. My congratulations on what must have been a difficult and time consuming job and good luck on completing the restoration.

At some time in the recent past there was a discussion in this or the antique radio group about coil dope. As a result I tried making some. While it appears to be still available its hard to find.

What I did was to dissolve polyfoam shipping material in a mixture of MEK and xylol. I chose these two solvents because both were listed on the lable of some old commercial coil dope.

The result is that the stuff works fine. The solvent will dissolve an amazing amount of the polyfoam, probably because its mostly air. After I got the stuff to a good honey-like consistency I tried it. It dries hard in about ten minutes. Polyfoam is polystyrene which has excellent dielectric properties. This is what the commercial coil dopes were made of.

Both solvents are available from hardware or paint stores and are cheap. The polyfoam can come from styrofoam cups but shipping material is the same stuff and is often just tossed away. All that matters is that its clean.

Dissolve the polyfoam in gasoline and what do you get?
Napalm!

Paul, KD7HB

A helpful hint:-) I thought it was soap but I've never
seriously wanted to make any napalm.

    Turns out we are both right. Modern napalm has
```

polystyrene in it, the original used a sort of metallic soap
as the thickening agent. See:

http://en.wikipedia.org/wiki/Napalm

I still have no desire to make any.

When I was a kid, we just added styrofoam to toluene until we got about the
right viscosity.  I have coils that I varnished with that stuff thirty years
ago which are still just fine.

Proportions, please?

Mostly MEK. I added a little Xylol (AKA Xylene) because I thought I saw it listed in an MSDS for coil dope. However, the MSDS for the General Cement product lists only MEK although the thinner is Toluene. If I do it again I will use straight MEK. I added the styrofoam until the stuff got to what seems to be the right consistency, about like honey. Mine came out a sort of gray color rather than clear but the pictures of the General Cement Q-Dope also look gray. My styrofoam was scraps of shipping material from something I mail ordered. It is amazing how quickly it dissolves, at least at first. I used a small, wide-mouth, bottle I got years ago. I would test the cap of any container you plan to use with a little MEK to make sure it will not be attacked. MEK is a rather wide spectrum solvent which will dissolve latex and a number of other substances.

I will make some measurements when I have a little time to see if my dope affects coil Q. Commercial dope has very little effect.

MEK is available at any paint or hardware store and styrofoam abounds. One can use styrofoam cups but I think a sufficient supply can be found free.

I tried making my own after working on an old Hewlett-Packard signal generator (606-A) where the high band coils must be fastened down with it after adjustment. I found none of my usual local suppliers had the stuff. I have since found that Action Electronics, in Anaheim CA carries it but that is a 30 mile drive from here. So, I decided to make my own.

Hi, All.
I've just commissioned the remote band-switch motor on a 1944 Bendix RA 10DB aircraft receiver, controlled from the remote unit that I had to partially rebuild. I had the schematic but no cables so I had to make them - what a pain! But what an incredibly clever servo system! Changing the band at the remote invokes a whirring and clanking as the motor drives the band switch though its travel to the right point. Here's a summary I wrote from the original 1944 documentation. Enjoy!

2-1-2-10 Band Change Circuit (summary by RJ from original documentation)

-- Motor drives switches S1 to S6 change the band. Mechanically:
     -- Motor armature to worm drive, ganged to a common shaft, crank arm, locking cam and control cam
     -- Motor control switch S8 rides on the control cam
     -- Crank arm and and locking cam operate a Geneva disc (What is this? RJ)
     -- Hollow shaft of Geneva disc is slottrd at one end to engage the locking pin of a long drive shaft
     -- Long drive shaft passes through the Geneva disc, drives the motor positioning switch S7 and runs through the RF coil and can assemblies
     -- Band change switches S1 to S6 operate together on this shaft (see note to section 6-4-1-2)

-- Remote control unit band selector switch S101B selects band
-- Band switch motor B1 is energized by completion of its return circuit to ground through contacts on S101B and the shorting contact on S7
-- Motor B1 drives the crank arm through one or more complete revolutions (depending on band selected)
-- This steps the Geneva disk to the desired position
-- At this point the motor is automatically de-energized by an open slot in the shorting contact of switch S7
-- Exact position control is obtained by the cam-operated motor control switch S8

-- When motor B1 is at rest the arm of S8 is on step 2 of the control cam and all contacts are open
-- When motor B1 starts the arm is first raised by step 3 of the cam, closing the upper contacts
-- These contacts close the reversing field of motor B1 to a selected rotor on the positioning switch S7
-- These selected [S7] contacts connect to a non-grounded position on S10-1B, thus the motor continues to run
-- When the arm of switch S8 drops to step 1 of the control arm, the upper contacts are opened and the lower ones are closed
-- The closing of the lower contacts provides an additional path to ground to keep motor B1 energized after the opening of selector switch S7 by movement of the Geneva disc.
-- When the crank arm has been driven past the Geneva disc, engaging the locking cam with the arc of the disc, the control cam raises the arm of motor control switch S8 to step 2, opening all contacts.
-- Motor coasts to a stop
-- If motor coasts past step 2, the upper contacts of S8 will be closed, effecting a return to ground for the motor reversing field through S7 and S1010B.
-- Motor will then reverse to drive the cam back to the proper position with all contacts of S8 open and the motor at rest.

Phew!
Now to sort out the AVC/MVC function (remote unit switch) and check the RF/IF/detector/audio.
Cheers,
Roger

How to make a square pyramid net diagram? Hey everyone! I have to build a model for geometry and it has to be a cube with three congruent square pyramids that fit perfectly inside of it. I'm making a net diagram that will show the congruent square pyramid and its measurements and dimensions. I'm not really sure about how to calculate it though. My cube is going to be 5x5. If anyone could help, that would be great.

AVC/MVC function (remote unit switch) and the RF/IF/detector and audio
(the latter through the remote unit) all working.
Will replace original B+ filter caps as there is a lot of dynamotor
hum.
I now need to clean up the cabling, commission with the Interphone
unit and wrap it up as a museum demo on our Lancaster project.
See  http://casmuseum.org/about.shtml
Cheers,
Roger

I have added a new article with photos and dimensions for anyone who would like to build a replica of the Hallicrafters R-12 console speaker (companion to the SX-28 receiver).

http://antiqueradio.org/HallicraftersR-12Speaker.htm

These speakers are pretty scarce. I've never seen one in the flesh. You may enjoy seeing some photos and a 1940 ad, even if you're not planning to roll your own.

Thanks to Henry Rogers of the Western Historic Radio Museum (http://www.radioblvd.com/) for supplying the photos and building information.

Phil Nelson

Tolulene runs about 13-15 bucks a gallon at Home Depot, Menards, etc.
You won't ever run out of it if you buy a gallon can!
On top of that, a trick many racers use is to add some to gasoline to
up the octane. In Baja races in Mexico you never know what the octane
of the stuff you are getting may be.

I have digressed, I see...a habit as I age. In any case, I have also
mixed a small amount of tolulene with dried up tubes of plumbers goop
in order to reactivate the stuff. Afterall, drying goop is because of
the evaporation of tolulene in the first place.

I wonder whether someone can help me to clear an issue regarding AM signals produced by a (class-C) tube transmitter.

It is well known that the peak-envelope power of a carrier 100%-modulated by a pure sine wave is four times the unmodulated carrier power. This is simply because, according to the Ohm's law, doubling voltage power gets four times higher.

I would have no problem if a tube would behave like a normal resistor. But a tube instead behaves like a differential resistor, and this makes a lot of difference.

If you consider the plate characteristic of a typical pentode, you see that plate current does not change much increasing plate voltage. So, doubling the plate voltage, power would not get four times higher, but just a little more that two times.

The triode plate current is instead much more dependent on plate voltage so that, doubling plate voltage, power would grow probably at least three times. But definitely not four times.

Can someone pinpoint what I am missing?

The ARRL handbook reports that the load seen by a modulation transformer is simply the ratio between the final RF stage voltage and its current.

Somewhere else I read that the calculation result should be reduced by a factor that varies with the RF stage operating class, i.e. 1.3 (class A), or 1.7 (class B) or 2 (class C).

Even though, in practice, the load value is not critical, I wonder whether anyone has got more information on the issue.

You could be a  bit  mixed up ... the  final is acting as  a  high
level mixer ...  you  end up with  a spectrum .. not a  single
carier .. in fact the  carrier amplitude is not  changed by  the
process (should not be ...)  that  is , the  additional power is in
the  sidebands

Hi All,

I have an old Hallicrafters SX23 S meter that came from a parts unit.
Is was functional at the time of removal. I can send photos to
interested buyers upon request. No idea what to ask for it, make me an
offer.

rgds,

Mark S.

If you need a replacement S meter for an HRO or any receiver that used
this kind of S meter circuit, fine. When I saw that S meter I thought
it would look 'cool' in a (solid state) QRP rig I was planning. But,
I'd have to come up with a 'bass-ackwards' meter circuit to make it
work. I suppose that the meter should end up in another HRO or similar
receiver that needs a replacement though.

The reverse-movement meters are WAY more expensive and hard to find than

```
typical meters.  If you want a cheap movement for a homebrew QRP rig,
check out Fair Radio... they always have something interesting and
inexpensive, often with a weird scale marked "roentgens" or something.

Fred,

That might very well be the case. I can go in with my o'scope and
see.

Thanks for the tip.

-Dave

National NCX-1000 HF Transceiver Rare!!!!!!!!
I got this from a friend who is getting up in years and he was selling
his collection.
I tried it on 75 meters and when tuning it up got about 350 watts and
then when I was on ssb and tuned it as I was talking, I got 625 watts
out.
Looks great and works great. I followed manual and the meter may not
be correct on radio for mils, but reads signal correct. Anyway, It
sure puts out watts and I talked off it for two days and great
reports.
No microphone. Radio and manual. Even the chrome on the front around

dial is shiny. Came from a non smoker. Looks Excellent!!!

```

Well, I fixed the problem.

My homemade coils/filters are OK. Using a signal generator, I applied
a 0.5 Vrms signal to the SB-610=92s vertical amplifier input and got a

trace on the CRT that was about 1 inch high (thick), which meets the specifications at 3.395 Mhz.

The problem was the 1 pf capacitor I used to couple the plate circuit of the SB-301=92s second IF amplifier to the SB-610. I raised this cap to 6 pf and now have plenty of signal for the SB-610.

Thanks for all the advice. It saved time.

-Dave Drumheller, K3WQ

I am building an AM transmitter using a 829B final tube (with the two tetrodes in parallel) operating in class-C (750V on plate, 200V on screen).

The modulation transformer has a single secondary winding.

To obtain both plate and screen modulation, I am planning to adopt the well-known circuit whereby the tube screen is fed by the 750V plate supply through a high-power series resistor.

I have two questions at that regard.

FIRST QUESTION

According to the ARRL Handbook (1968 edition), the screen resistor must be connected to the "hot" end of the modulation transformer secondary. This seems quite logical to me.

On the contrary, the EIMAC "Care and feed of power grid tubes" booklet states that the screen resistor must be connected to the "cold" end of the secondary. Their argument is that, when plate voltage increases (due to modulation), the screen current decreases and so does the voltage across the screen resistor, thus resulting in a higher screen voltage. In other words the screen is subjected to an automatic modulation effect.

Does anyone have practical exeperience on the pros and cons of the two methods?

SECOND QUESTION

To protect the final tube, I am planning to have a fixed negative bias on the control grid that sets the the tube close to interdiction (some 10 - 20 mA of idling plate current) in absence of RF driving voltage on the grid.

In such resting condition the screen current should presumably be very low, with a consequent low voltage drop across the screen resistor.

The screen voltage will set at some voltage that will surely be higher than the normal operating voltage (200V). I am not sure whether this can cause problems to the tube.

Would you have any suggestion to avoid such voltage growth effect, other than the classical solution of adding an extra clamp tube that, in absence of RF drive, draws current from the screen resistor?

Thanks in advance for answers.

There are two other ways of handling the screen voltage in a modulated stage. The screen can be feed by a regulated voltage supply and a separate winding on the modulation transformer is used to modulate the screen. A variation on this is to put an audio choke in series with the screen supply and to optionally couple the screen to the hot side of the plate modulator winding via a capacitor.

Unfortunately, as I had written, my transformer has a single secondary winding.

> A variation on this is to put an audio choke in series with the screen supply
> and to optionally couple the screen to the hot side of the plate modulator
> winding via a capacitor.

Yes, I had seen that method too on the ARRL Handbook (as well as in the EIMAC booklet), but I was trying to avoid the bulk of an extra choke.

Nevertheless, browsing the Internet, I found a dealer who sells 20H 50mA chokes of reasonable size at a reasonable price. So, I am getting more and more convinced that that is the way to go.

Still, I would be interested to hear from someone who has actually tried that method.

Thanks & 73.

You can also just ignore the issue and only apply modulation to the plate of the pentode/beam power tube. In theory you won't reach 100% modulation, however given that the screen input is a tiny fraction of the plate input you'll probably achieve somewhere between 95-99% modulation. You don't want to go over 100%, and unless you are using a speech compressor you won't ever hit 100% modulation peaks when properly set up anyway.

Another idea would be to use a second low power modulation transformer
with a separate amplifier feed off the same mike amp and with it's own
level adjustment to only modulate the screen.  You'd need two level
adjustments in addition to the main mike gain control to set the proper
levels for the high power plate modulator and the low power screen
modulator.  The screen modulator would only need to be a few watts,
maybe single class A 6L6 or 6V6.  I realize this is getting more
complicated than just the choke in the screen circuit, but that's the
```

beauty of home brew, trying things out just for the heck of it.

```

I sometimes tend to be perfectionist, and I would then not like to start a project pursuing a compromise solution from the very beginning. So, I would like to have the screen modulated too, not just the plate.

With regard to the separate audio amplifier for the screen, it should work but I am not sure whether some phase shift could occur between the two amplified audio signals (apart from the 180-degree phase ambiguity that can be easily resolved crossing the wires of one of the two modulation transformers).

I have come to the conclusion that using a filter choke on the screen probably is the simplest way to go, and the safest for the final tube too.

Tony-

What if you connected a capacitor across the screen resistor connected

to the hot end of the transformer? This might tend to keep the DC
voltage drop constant, while coupling more audio to the screen grid.

I think that if you do this, you have higher audio distortion even though you
have a slightly higher modulation level.

It depends mostly on how well matched the modulation transformers are. Most
of the group delay will be the result of the transformers.

Better to use a transformer with two secondaries than two individual amps.

>I have come to the conclusion that using a filter choke on the screen probably
>is the simplest way to go, and the safest for the final tube too.

Is the best possible fidelity important to you? Is having a tiny little bit
more modulation important to you? I think in the manuals to the Bauer 707
broadcast transmitters there is a paragraph or two about the compromise.

Station monitor used but in perfect aesthetics conditions (see in
photo), there are only some imperfections due to the time.
The electronics is perfect, and the catodic ray tube works perfectly,
the item has been used as oscilloscope up to few days ago.

The auction includes:
Original box,
manual copy (or if you don't want it, it's possible to download it
here)
Kenwood SM 220

The optional BS-8 is not included

Frad,

I am afraid I am unabke to follow your reasoning.

I cannot see how adding a capacitor, even a BIG one, can help keeping constant the voltage drop across the screen resistor.

When you switch back from TX to RX, the screen current will go to nearly zero and the voltage drop across the resistor will then tend to do the same. A capacitor in parallel with the resistor would not succeed to keep the voltage drop constant, as it would get discharged in a very short time.

I can email scanned pages of the entire "manual" (two pages!-) of the
Archer
60-4005 "Space Patrol Walkie Talkie" or I can put them on my website
and
let you snarf them yourself. Your call.

Hello,
as a winter project I'm restoring an SP-600, just finished the mechanical
part I'm working on the electronics.
I wonder if anybody in BAland has tested the BFO waveform and say if I'm
right or not.
Checking the point between C132 and L46 the waveform appear ugly and
distorted, only .5 Vpp.
Everything is correctly wired and components are good, as witness, the grid
of V13 shows a magnificient 8 Vpp signal.
Can you help me?
73's de Claudio

On old tube manual shows that the 6F6 in push pull triode connection with self bias (730 oh cathode resistor) delivered 14 watts with 350 volts on the plate and a load resistance of 10,000 ohms plate to plate. With fixed bias (-38 volts) it would deliver 18 watts into 6000 ohms plate to plate. For fixed bias the input transformer ratio primary to 1/2 secondary was 1.67. For self bias the ratio was 1.29. The driver tube would also be triode connected, 250 volts plate, -20 volts bias and a plate load of 10,000 ohms.

No figures given for operation at 250 volts for the output stage, but the output impedance would be about the same and resting plate current would be adjusted to about 45ma. Power output would probably be about 2/3 the value at 350 volts.

BTW, the types 42 and 6F6 are the same except for the base, types 42 and 2A5 are the same except for the heater voltage.
(some SP models might have used the other tubes)

The tube lineup in the SP210 was 6K7x2(rf), 6L7 mix, 6J7 vfo, 6K7 if#1, 6SK7 x2 IF 2-3, 6H6 detector, 6N7 nl, 6SJ7 bfo, 6SK7 avc, 6H6 avc rect, 6C5 af#1, 6F6 driver, 6F6 x2 output, 5Z3 rectifier, 80 rectifier

Must have had two different plate voltages, hence the two different rectifier tubes. The SP400 power supply used the second rectifier as a bias rectifier, maybe that's what was done here? I'm looking at the tube lineup from the book 'communications receivers' by R.S. Moore.

I noticed the same thing when I re-capped my SP-600 back in 1999.  I
made up a FET buffer to go between the grid of V13 and the grid of
V12.  The result was a much cleaner beat-note.  --Ed

I know this is a very long shot, but I wondered if anyone has a
geiger-muller tube lurking anywhere?
Perhaps you may know of a supplier or have an old geiger counter that you
may wish to dispose of?

Mr G4

I never thought to test this. I just looked at my SP-600-JX-17. I looked at two places: the first is the point you specify above except that I looked at pin-1 of V-12, the BFO buffer tube. At that point the waveform shows a lot of ripple, probably harmonics. I also looked at pin-5, the output of the buffer. At that point the waveform is a fairly clean sine wave. It shows some distortion but not much and I doubt if its of significance. A warning about this measurement: the plates of the BFO buffer and IF driver are connected directly together so that the IF ouput to the detector exists at this point. In order to see the BFO waveform clearly you must put the AVC in Manual and turn the RF gain all the way down. Otherwise you will see the IF output and its noise at this point.

I checked this with a Tektronix 453 scope, which is good to 50mhz so it will show a 455khz waveform and all harmonics.

I used a standard probe with the X-10 switch on. This increases the input impedance of the probe to a very high value. If used in X-1 the waveform shows flat-topping due to loading, this may be the source of your bad waveform because this is a quite high impedance circuit. It may be that the slight distortion I am seeing is due to the load impedance being too low even with the probe in X-10. With the probe in X-10 the voltage at this point is not quite 40V p-p. Other models of the SP-600 have an adjustment for the cathode bias of this stage in order to provide a level control for BFO injection. Normally, its set from the factory for zero bias but normal bias for maximum gain of a 6BA6 tube is about 1.0 volt and I set my JX-21 for this value. Probably running the 6BA6 at zero bias shortens its life a bit and the extra injection level is not necessary. In the JX-17 the bias and level are fixed. I am not sure why the level was made adjustable. In some older receivers it was done to prevent the BFO from activating the AVC and causing desensitization.

I also re-checked the waveform at the cathode of V-12 and get the same harmonic rich signal I do at the grid. Evidently, the plate choke coupling of this stage is selective because the plate waveform is very much better.

Since there is already a buffer for the BFO I don't think adding an additional one is of much utility. These are pretty well engineered receivers and, I suspect, most modifications do not improve them.

That one only responds to Gamma radiation, not Alpha and Beta particles. A
GM tube to detect all three has a different construction- in particular a

thin window which will pass Alpha and Beta particles which normally are stopped quite easily.

If the Geiger counter is for private/demo use then sources will be an issue. Alpha and Beta sources are quite common- smoke detectors use an Alpha source (can't recall the name) and "Tritium" lights (as found in some signs, compasses, watches etc.) are Beta sources.

I don't recall any readily available sources of Gamma radiation- although it is used extensively in medicine.

Okay. I don't know anything about them but had recalled seeing the ad for this one so I thought I'd pass it on. According to a previous post, it apparently isn't what you might want either.

Good luck with your search.

I need a manual or at least some information for a "TS-1100/U Test Set, Transistor". I've found two by "Googling": one company wanted $6.00 but its website is down, the other wants $23.00 but I hate to pay that much when all I want to do is "play" with the test set. In particular, I'd like to know what battery voltages are required, where they go (apparently it can use two different sets of batteries), and perhaps the circuit of a "battery eliminator" for it.

Once upon a time I recall the type CK1026 GM tube. This was about the size of a 50C5 tube, but with a single pin and an aquadag coating on the outside of the tube. This tube was used in a geiger counter project that was in one of Alfred Morgan's 'boys books of radio and electronics', either the 2nd or 3rd book. There were other types of GM tubes made, but the CK1026 was one of the least expensive and was used in many simple radiation detectors.

There were other types of GM tubes made, but the CK1026 was one of the least expensive and was used in many simple radiation detectors.

The ones used in the 1960's radiation detectors and then sold in a pack of 3 for $1 at Radio Shack in the late 1960's looked like long neon bulbs with an extra wire comming out of them. I think they were around two inches long, but it's been a long time since I've seen them.

Considering that they were designed to detect levels of radiation that would only exist if you were close to ground zero and poking your head out of a shelter in the rubble of an east coast (US) city, for all I know they really were neon bulbs. :-)

Geoff.

You probably could use a Neon bulb as a radiation detector. You'd have
to keep the tube in the dark (inside a black plastic box) and carefully
adjust the voltage across the tube so it was just below the firing
voltage (need a well regulated power supply). Then an alpha or beta
particle might be enough to trigger the tube into conduction. The
sensitivity would be determined how close to the firing voltage the bias

supply was set.

The thing about these is that the glass is designed to block lower energy radiation. Still, if you want to detect background gamma radiation, it's not bad. It's probably okay for beta radiation too although you don't know until you test it.

The market is glutted with Victoreen survey meters. Millions of them were made for the civil defense folks in the fifties and sixties, and they are all on the surplus market. They also don't respond well to lower energy particles, and the scale calibration is useless because the integrator stage is intended for use in very high radiation environments, but they are very cheap.

Nice images. I guess the box is still original Heath fabrication, as it
was shipped 40-50 years ago? I have uploaded some new Heathkit images
last week, in no small part thanks to N4TRB! Both RX-1 and TX-1
side-by-side can be found here:

But there was also a need for geiger counters so you could go out and prospect for uranium. I hadn't given it a lot of thought, until a few years ago when I found a "magazine" about how to prospect for uranium. I guess it was published by Fawcett, from the fifties, when it was common to issue single issue magazines that would be books if they were published more formally. I have no idea how common the "hobby" was, or how many geiger counters it sold, but it did seem a big concept for a while. Robert Heinlein even has some bad guys in one of his juvenile novels prospecting for uranium on the moon.

There have been solid-state replacements for geiger tubes in recent decades, but at the moment I can't think of what. Some projects used existing components that reacted to radiation, but I seem to recall there were solid-state devices that came along.

I recall being unconvinced when a customer complained that the neon
lamp in his old, rotary disk type depth finder would not work at night
unless he shined a flashlight on it. He was absolutely correct, and
as time went on, we found that as all neon flash lamps (mostly NE2's
and NE51's I think) grew old and weak, they required a little extra
external excitation (flashlight worked ok) to light.

The 80 tube (5Y3 in later versions of the supply) is a -50 volt bias supply for the AVC and other circuits. The SP-600-JX has a similar arrangement but using a 6AL5 as the bias rectifier.

Earlier versions of the Super-Pro did use glass tubes. I think there are a couple of early instruction manuals on line showing this version. The early 1940's version used all metal tubes except for the rectifiers and post war sets including the SP-400 used a 5U4 in place of the 5Z3 and 5Y4 in place of the 80. These two are identical except for the base and envelopes.

> Here is the manual for the SP2xx aka BC779
> http://63.227.91.114/Common/Manuals/Desc_Manuals.php/

Note that there were three versions of the SP-200/210 with different frequency ranges. The standard version covered from 535 Khz to 20mhz, the second version covered from 1250 khz to 40 mhz and a third version, which carries the military designation BC-779 covered from 2500 Khz to 20 mhz plus 100 khz to 400 khz in two bands. These were intended mainly for aeronautical work where the low bands were used for navigation aids and for control tower communication.

The circuit of the standard version and low frequency version is quite similar but the high frequency version uses shunt fed RF amplifiers rather than series fed in order to get higher Q and better image rejection. On the broadcast band of receivers having it there is a resistor across the RF tanks to _lower_ the Q and increase the bandwidth in order to obtain high-fidelity reception.

The headphone connection to the transformer in the later series receivers is loosely coupled so that plugging in headphones will not affect the level of the regular 500 ohm output. This is in order to allow local monitoring of a receiver connected to a phone line or recorder other use without disturbing the level.

Some Super-Pros were evidently modified to allow crystal control of the receiving frequency. I have seen pictures of these but have never seen a circuit for it. These receivers would have been used in fixed frequency operation. They had two knobs over the main tuning dial, presumably one for choice of crystal and the other for fine adjustment.

It's not so much that they needed light, but they could no longer light
up with the old value resistor. Changing the resistor would have worked,
as did the external excitation with a light.

That was the previous point, you put enough current into the neon bulb
so it's not quite lighting up, and then external radiation would excite
it. It's about setting a threshold right below where the bulb lights
up, and then any external excitation ignites it.

Is anyone willing to sell me a CMS-1 speaker for the Mosley CM-1 receiver?

With the low $, I can pay a (reasonably) good price.

Probably more a question of voltage supply rather than resistor value,
as unless the neon fires, the drop across the resistor is zero, and so
the resistance value is not controlling the starting.

Peter

It still has the original heathkit box.
It is going to a new home, courtesy of this newsgroup.

And thus the irritating (and sometimes useful) Neon tube oscillator!

GM tubes don't work quite like that. They have a halogen gas in there as
well to "quench" the conduction caused by the radiation.

Sparkfun.com sells a 712 end-window geiger tube from LND, Inc. It's sensitive to alpha and beta particles as well as gamma radiation, and it's something like $70. They have a complete geiger counter kit which includes a DC-DC converter to get the 500V for $140.

They currently have a promotion going on which is causing their site to be hammered, but it should be back to normal in a day or two.

I'm restoring a 420 tube AN/FRR-24 triple diversity HF receiver - all 3121 lbs of it.
I need a few more rack-mount modules -
    CV-127/FRR-24 FSK converter with scope
    PP-648/FRR-24 & PP-649/FRR-24 power supplies
        (any FRR-24 or FRR-37 power supplies will be very helpful)

Also looking for rack-mount modules for AN/FGC-5 and AN/FCC-3 telegraph (TTY) multiplex systems.

AR88s are a good start.   I have an AN/FRR-59.
I don't think it has moved in 20 years.

Does anyone have any catalogs from the 1950s-'60s that list Crest
Transformer products? I need some info on a Crest transformer:
Crestran 306FL-196.

I am also looking for an old relay tube; 115NO7T

Thanks,

I've moved my FRR-59 three times in the last 5 years while we moved. The next time my kids will move it. This will be payback for all of the junk they left me to clean up.

You have not really lived until you install one in a rack by yourself.

Amen - I installed my "lightweight" FRR-59 is in a rack next to the Big Guy - the FRR-24 is 4 racks worth but the individual modules are only 40-90 lb. each. My middleweight receiver is a dual-diversity FRR-60 (TMC DDR-5) - it's 2 racks and about 1200 lbs total. My buddies are gonna have a great time getting it all out of my basement after I'm gone!

cheers,
Nick K4NYW

In the AM transmitter I am building, the power supply is structured in such a way that it is not possible to measure the final tube plate current at a low-potential point.

So I have decided to connect the tube cathode to ground via a 1-ohm resistor and measure the voltage that develops across that resistor.

I know that, doing so, I will be measuring the sum of plate current (around 200 mA), screen current (around 20 mA) and grid current (around 7 mA). But tuning the transmitter Pi network for minimum total current should still work fine. Any comment?

You are exactly right..Be sure to bypass the the cathode resistor with
something like a  point  01  cap . Good luck   W4PQW

hi. i've got a hallicrafters sx-42 that has developed a strange s meter
problem.the receiver works on all bands but the s meter works normaly only
on the first 2 bands,broadcast band and band 2 (1.6 to 5 mc). when I switch
to band 3 (5
to 15 mc) and bands 4, 5 and 6 i hear signals but the s meter indicates
zero. occasionally
there will be a very slight negative indication with the needle moving below
the zero. it
must be getting ok avc on the first 2 bands but not on the others. does
anyone have any
suggestions?
73 ci

ci-

My understanding is that the S-Meter is measuring a negative voltage (AGC) that is developed at the AM detector, and is used to limit the amplification of an earlier stage.

For the meter to read down-scale, there could be either a vacuum tube that is "soft" or a DC Blocking capacitor that is leaking. You may find

a tube that has positive voltage on its control grid. That could either
be caused by the tube or the capacitor that feeds it.

The only thing you won't be able to do is to measure the plate input
power of the transmitter, which for your application isn't a requirement.

Yes but the meter reads correctly on two bands so the tubes / capacitors
must still be ok. It's possible that there are capacitors tied to
specific coils that get switched between bands, but my bet would be that
you have a high resistance contact on the band switch. Get some switch
cleaner spray and have a go at that switch. After spraying the contacts
rotate the switch back and forth around the bad positions to get the
cleaner to do it's work. Also check the coils for an open winding, or a
bad solder joint that has gone high resistance between the coil and the
band switch.

My only concern is that tuning for the minimum cathode current may not be as sharp as tuning for the minimum plate current, because when plate current decreases the screen current increases (though only about 1/10 in magnitude).

> hi. i've got a hallicrafters sx-42 that has developed a strange s meter problem.the receiver works on all bands but the s meter works normaly only on the first 2 bands,broadcast band and band 2 (1.6 to 5 mc). when I switch to band 3 (5 to 15 mc) and bands 4, 5 and 6 i hear signals but the s meter indicates zero. occasionally there will be a very slight negative indication with the needle moving below the zero. it must be getting ok avc on the first 2 bands but not on the others. does anyone have any suggestions?
> 73 ci

I am not sure the S-meter measures AVC action directly. On my Hallicrafters (and other) receivers it measures cathode or plate current in some tube. These meters are usually reversed, i.e., when off the pointer goes to the right (high end) of the scale. The meter in the SX-42 is switched and also acts as a tuning meter for FM. It also appears to be switched for different bands but the schematics are confusing and I have not traced out the meter circuit.

Check the tube socket voltages and resistances for a start. Also, it should be obvious if the AVC is working or not regardless of the meter.

The SX-42 is notoriously difficult to work on so I wish you success and a good supply of patients.

Is there any way that the tube can fail in such a way that the cathode current
is good but the plate current is not?  Screen damage?

Another idea would be to connect an rf voltmeter to the antenna
connection and just tune for max rf voltage.  This is the best way to
tune a screen grid power tube anyway.  Most ham rigs have a meter
position to tune for max power output, and this usually is just a diode
connected through a small capacitor to the antenna output of the rig.
The diode is connected through a resistor to the meter, and the meter is
bypassed by another capacitor.  Sometimes a resistive voltage divider is
connected between the diode and the coupling capacitor to the antenna
terminal (for high power rigs).  Should be some circuit ideas in older
ARRL HB's.

Kenneth,
thanks for the link and informations about the transformers. It appears
I have to find someone who can make them or find some old original
replacements.
By the way, the model I have is the one with 100-200 Kc and 200-400 Kc
bands.
best regards
Frank IZ8DWF

Yes, I think this is the problem.

I put my oscilloscope on an isolation transformer and placed its probe
across the tank circuit (filter) at the output of the vertical
amplifier that drives the SB-601's cathode ray tube. With the SB-301
receiver tuned to it's internal 100kHz crystal oscillator, I measured
an 80 Volt peak-to-peak swing for a 1/2-inch thick trace, indicating
that the deflection constant for the CRT is about half of what it's

supposed to be. I suppose I could re-engineer the SB-610 to account
for the weak CRT, but it isn't worth it.

My skanti-trp5000   tunes the  valve  stage by measuring the  rf
voltage on the  plates ....the  'level' is set at  voltage
such that the  tubes are  matched to the  correct load .. and  maximum
power out occures ..all you  need  to  do is select medium power and
tune (2 tone test) to the  pre defined voltage level .. thats 150
watts  carrier  power out ,

G .

Does anybody have an old large panel meter (case inside dia of 3"). The
meter can (should) be broken as all I need is the outside case. I need
a bezel for a 3" CRT and a case from a broken panel meter with a 3"
(inside) diameter would work fine.

I found THE solution to measure current flowing though a wire at high potential without risks!

Solution is to use an Hall-effect transducer of the same type used in the newer clamp meters (those able to measure both AC and DC currents). One can order transducers with full-scale currents ranging from as low as 10mA to tens of Amps. The high-potential wire passes through a hole having a diameter of two centrimeners, so it is fully insulated from the measurement circuitry,

The transducer can directly drive a meter having a full-scale current of 20 mA or less. See http://www.chenyang-ism.com/

If the plate supply has it's own power supply with a separate power transformer or winding the meter can be placed in the negative lead of the power supply. Be sure to place the meter outside of any bleeder resistors so you don't measure the bleeder current.

Thanks for your suggestion, but in my initial message I had mentioned that my power supply is structured in such a way not to permit measuring plate current on the negative lead as it would otherwise be normal to do.

As a matter of fact the low-voltage supply is part of the high-voltage supply; they are not separate. Therefore the current flowing in the negative lead is the sum of the currents of the two supplies, and it is then not possible to isolate the plate current of the final tube.

Unfortunately no alternative to measuring it on the high-voltage lead.

Most good panel meters (Triplet, etc) 2" or larger in diameter in thick
Bakelite cases having glass windows are probably insulated well enough
to safely be used in the high voltage side up to at least 1kv (or more).
  I wouldn't try it with a cheap imported meter in a thin plastic case
and a plastic window.  Back in the days when REAL transmitters were
housed in relay rack cabinets it was the norm to put an ammeter in the
HV lead.  Note that trying to switch a single meter between grid,
screen, plate, and HV readings (meter is used as a voltmeter and reads
voltage across shunts for current) gets tricky, a WELL insulated switch
is required with good isolation between selections!  Using every other
position of a rotary switch and yanking out the unused contacts might
have been common.

I'll look this evening, or tomorrow. Do you want metal or plastic?
Where are you located? I am in Oregon.

Paul, KD7HB

I'm in south Florida (FTL area). I think plastic might work out better,
but if it's non-magnetic metal (brass, aluminum, etc) that should be OK
too. The ID needs to be at least 3" so the CRT will fit. Most 3"
meters are a bit smaller than that, I know they made larger ones, but
not a popular size. I don't need the movement so if that's toast so
much the better, rather than destroy a good meter. Of course if it has
a useless range like 200A DC who cares?

My Geloso transmitter just adopts the arrangement you mention. But I would prefer to avoid it, mainly because of the HV present on the meter switch.

The Hall-effect transducer seems to be perfect for measuring current forgetting about HV. When I will get it I will report whether it really works fine for our applications or not.

Tony , I should think it  will be ok , may be will need a  little rf
screening ... as a  Idea try using a  coax as the  plate
supply  cable , with the  braid earthed ...  the  copper  'should'
```

not affect the magnetic field ... try it out with a low voltage
psu and resistor as a load ?

G ..

I will try but I would not expect RF problems because the Hall transducer will be located inside the modulator screened enclosure and inserted before the modulation transformer where there is plenty of bypass capacitance to ground.

Does anyone have any reports of radio amateurs being involved in the Haiti disaster relief?
On a related point, we've heard very little in the media about radio being used in relief communications - it's been all about no wired phones, little or no internet, few cellphone towers, some twitter use, facebook groups, etc... where's the good, old fashioned analog radio?
Cheers,
Roger

They don't use "good old fashioned analog radios".

They go over to .equipment or one of the other newsgroups related to operating, because nobody would be using boatanchors for emergency communication at this point. Too big at the very least, use up too much power, lacking in capability.

Now, if you want to talk about WERS back in WWII, or other early use of radio for emergency, then this is likely the right place. Otherwise, it belongs elsewhere, and there are plenty of newsgroups for that.

When we had H'cane Marilyn+Luis simultaneously hitting Anguilla in 1995
the Cable&Wireless guy showed up with a sat phone in a briefcase.  He
plugged in the exchange and whammo...we had outside contact again.

Granted Anguilla is a small place but also granted that was 15 years
ago.  I'm sure the communications guys are getting Haiti plugged back
into the world although local distribution suffers.
```

Some of the first reports I read were from a 'twitterer' outside of the city using a Blackberry. The ham freqs are very quiet.

Its a new world, isn't it?

-Bill

Twitter? Cell phones? Ad nauseum. What fools.

Such technology is the salvation that is what they'd LIKE us to all believe is the answer. They are foolish to rely on the frailty of such technology. I'm sitting here now listening to all sorts of shortwave from Jamaica, Cuba and the Dominican Republic, all countries in the same region as Haiti. To castigate so-called "big, old boatanchors" is mindless nonsense and they are shooting themselves in the foot not employing "old" analog technology.

If you are dehydrated in the desert, you're ignorant to ignore a pond of water while you search for a crystal champagne glass.

ci

Well, we are in luck, maybe. I have a meter here that is 3.000 inside
the removable back plate. However, below that, the case ID is reduced
to 2.910 inches, making a ledge for the back to rest on. The whole
case, front and back, is a single molding. The lower 40% of the meter
face is part of the molding. If you need the entire front of the scope
to be viewable, the case will need to be chucked in a lathe and the
front turned off. The window part of the case is glass cemented to the
case.

This meter came from an old German made wave solder machine that
registered the chain speed in meters per minute. It has internal
circuitry. The size is certainly Metric.

I can send pictures if you would like. I can also try to turn off the
face in a lathe, but it would be much better if you supervised the
operation so you get what you want.

I may have more meters at work, but probably none that come this close
to the size you need. Will look for the box on Monday, but I think
they are all smaller.

If this works for you, just pay for postage.

Paul, KD7HB

How about a 3 inch bezel and a 3 inch crt with socket. I have one in my
junk box.

Any suggestions, pointers, and help greatly appreciated. This may not
be the right forum but I'm not sure what is!
I've acquired a 4-channel, 5 speed reel-to-reel audio recorder used by
the Navy and others for signal intercept and analysis. But I need a
manual or schematic to get it running - the only manual I have found
reference to was published by the National Security Agency.
It is AN/TNH-21, manuf by Video Research Corp, Riviera Beach FL
Photos at http://www.navy-radio.com/record.htm
cheers,
Nick

I was thinking about offering him my old military surplus 3" scope but thought he might have more fun with a meter housing. The scope was an Air Force MARS issue and I used it for RTTY tuning. Boy, was that a long time ago!

The argument is valid for all modes, including even SSB.

"You're five and nine OM."

"Please repeat."

"You're five and nine.

"I don't copy, can you repeat that?"

"I said you were five and nine."

"Oh, yeah. You're five and nine too."

"What did you say? I missed that."

Jeezy Louisy...lighten up.

I started this whole thing just to suggest a calling frequency. The thread is turning into a moral indictment.

This is most likely the reason I find myself working on vintage gear a lot more than operating it.

3599 kc's? The apostrophe indicates possession. Is that
intended to be plural? Kilocycles is already plural.
Rather like the lids that use 73s.

73, Roger

Are these the same "gentlemen's agreements" we enjoy on contest weekends?
Try to operate and NOT be in the contest!

Maybe some of us a sick of righteous snobbery from guys who didn't get into
the hobby
until
after they made the license easy enough; then they shoot off their mouths
with
their lookatmeimanextraclass callsigns and act like they own the hobby.

Your adolescent humour is as weak as your attempt at satire. By the way,
yes, CW IS a superior mode. That's why newbies like yourself are so
threatened
by it.

There are a lot of us who in fact do not feel the litter of

ham pups are worthy. They've (you've) done nothing to prove you earned
anything much
less belong to a fraternity of others who had to do much more to join.
Maybe some us us just want to talk to a genuine ham operator instead of
shallow transparent pretenders.

Quig

The apostrophe also indicates missing letters i.e. Amos 'n' Andy (Amos and
Andy), 'Tis (it is), F'rinstance (for instance).
KC's could be kilocyc'les although more proper would probably be k'c's
although stupid.

If you think that CW Ops have had spectrum taken away from them on 75/80 when they have and still have access to the *entire band* from bottom to top, You might want to try operating some more, OM! 8^)

This thread has really gone nutso. Shoot, you'd be hard pressed to make
a contest contact on 3599 on a contest weekend. I don't understand the
beef.

No 3599 xtal here but I'll certainly keep an ear out there even if
there's half a concensus for a good gathering spot.

-Bill WX4A/KP4

No it isn't a superior mode. I'm not a no coder, and I'm not a newbie.
And the very last thing I am threatened by is CW.

What I am is annoyed by Hams who think they are superior. Hams who think
that because they know a particular mode that they are superior.
And you don't know what satire is. I speak truth.

You might want to check me out, Quig. I'm not who you think I am. I am very supportive of CW. I don't use it much, but I do what I can to support it, and can have an actual influence doing that support.

Now on to another opinion, but one grounded and likely to be very true.

I'm presuming that you place great stock in a person knowing OOK Morse. Okay, that's a worthy goal. Another possibility is that you would like the mode to continue, and to thrive. That is one possibility. There is another darker possibility that I have seen in some Hams. Some older Hams become quite cranky and quick to anger. They end up believing that new Hams are inferior, and that there is no worth in them, and while they claim that the old ways are superior, they have no desire to have them continue, in fact, they believe that these old ways should die out with them. Many even show signs of active mental and social sabotage.

The concept that the problem lies within these unwashed new guys and gals is specious. The word lid came in to use long before the nickel Hams and no-coders. The great 20 meter wars all happened between well tested Hams who knew Morse code at a proficient speed. The Hams jamming each other on 80 meters appear to also be folks around long enough to had more to do to join the fraternity.

So yes, there are new hams who are lids. But yes indeed, the Morse code test did not filter bad hams out in the good 'ol days. It isn't a good argument. It's a test of mechanical skill, not of social worth.

On a little side note, neither did the tests themselves. The only real difference that I can see are that the older tests had more questions regarding tube technology. That's perfectly understandable. The complaints about Dick Bash and eventually the question pools end up being specious also. It is true that before the VEC system, that question pools were not published. What does that mean?

Not much. I have an old Ameco Test guide from 1958. Some of the questions in that test guide, which says that it's questions are "similar" to what one might see on an F.C.C. exam are in fact verbatim to what some question pool tests are now. Similar indeed!

So back to the idea of what people who love OOK Morse might do. Do you love it, do you think it is a worthy thing? Then get out and show newbs some of that Morse goodness. Let em know that Morse code, by virtue of it's narrow bandwidth, is like running a linear amp compared to SSB because of it's concentration of power in such a small area. Show them the joys of simple transmitter construction with which they can talk over the world.

Wanna kill it? Be petulant, be sure to let them know that until they know Morse Code that they are second class citizens. Then even if they learn it at 5wpm, make sure you let them know that 5wpm isn't even really knowing Morse code, it's like a lookup sheet. Make sure to let them know that they'll never be as worthy as the hams in the old days.

So anyhow, which are you? Do you care, or are you just enjoying your discontent, and trying to spread some of it around.

Now, you might wonder, who is this guy who says he supports Morse CW, but doesn't use it, and gets his hackles up when I complain about his lack of worthiness? Why would anyone hold such an opinion?

Because I'm deaf. I read lips and have estimated 70 db tinnitus, as well as I can't hear anything higher in frequency than 2 Kilohertz. What I can hear is as much as 200 db down, but as high as just 30 db down in some spots. Took me months to learn Morse to any degree. I can operate CW if the signal is very strong, I have headphones on and it's turned up *really* loud. Background noise or weak signals makes it just about impossible. I can do SSB a lot easier, but still have to turn it up fairly loud. My wife can hear my headphones while I'm operating while she's in the living room over 50 feet away.

And before you talk about things like using lights, above 5wpm, they get hard to read, and besides, did you know that a lot of Morse code proficient Hams won't converse with you at that rate?

I suspect that if you had your way, this particular runt in that litter of Ham pups would have been put to sleep pretty quickly, eh? Really, it's no problem. I do enjoy Ham radio, though.

- Mike N3LI -

Guys: It is not too late to avoid getting nothing but socks and neckties for Christmas.   Drop some hints with your loved ones and you too can find "SolderSmoke -- The Book" under the tree. Lots of Boatanchor stuff in there.

SolderSmoke -- A Global Adventure in Radio Electronics
From Crystal Radios to Podcast MP3s
With Occasional Forays into Astronomy, Kite Aerial Photography, and Model Rocketry

SolderSmoke is the story of a secret, round-the-world, after-hours life in electronics. Bill Meara started out as a normal kid, but around the age of 12 he got interested in radio... To make matters worse, when he got older he became a diplomat. In all of the places he has lived, his hobby caused him to seek out like-minded radio fiends, to stay up late into the night working on strange projects, and to build embarrassingly large antennas above innocent foreign neighborhoods. SolderSmoke takes you into the world of an expatriate geek. It is technical memoir filled with both funny stories and serious descriptions of Bill's struggles to truly understand the theory behind the equipment that he built.

My intention was to produce a book that is both fun and useful. The memoir part of the book is filled with what I hope are funny stories about my life as electronics-addicted diplomat. The useful part comes from the portions of each chapter in which I describe my struggles to really understand the theory behind the circuits that I was building. Throughout, I try to lace the text with inspirational descriptions of the fraternal, cooperative, international aspects of ham radio, of what we call "The International Brotherhood of Electronic Wizards." In short, its the kind of book that a techie would like to take to the beach.

Here is the web site:

Since making my original post I have read and appreciate all the comments made in response to that
posting. Thank you all for taking time to "weigh in." I too regret that the thread went nuts but such is
the demeanor of so many things here on the Internet.

Since posting my suggestion of using 3599 as a vintage equipment calling frequency I have listened extensively and am happy to report the following:

Johnson Adventurer
1929 MOPA (Type 203A driven by Type 10Y)
EICO 720
Heath DX-60
Johnson Viking 2
Johnson Ranger
ELMAC AF-67
Harvey Wells Bandmaster
WRL Globe King
WRL Globe Scout
Hallicrafters HT-32
Hallicrafters HT-46
Swan 350
Collins 32V-3
Knight T-60

Not bad for only one week's listening!

Of those, surprisingly, approximately 1/3 stated that they were using crystals (albeit crystals on 3597, 3598 as well as 3599). One gentlemen who I worked said that he had a crystal for 3902 but could not use it because there was a nightly CW roundtable occupying that frequency. I am familiar with the guys in that group and suggested he jump in....they'd love to have him.

If you're using a receiver like an SX-28 that permits you to sharpen up selectivity a bit, the edges of RTTY operation seem to be contained and permit a nice little spot to find some other classic station operators.

Thanks to all who have stopped by.

Dick,

I went back and read the thread and the frequency suggested was 3599 kcs
for BA CW.

Unfortunately, the thread has turned into a free-for-all rant among
those who have pent up grievances against all sorts of things from band
plans to contest operators to "dumbing down" the license procedures. It
is really a shame to see a simple and straightforward suggestion
provoking such an explosion of pent up antagonisms. I don't know what
the future of the frequency will be, given these circumstances.

I have to say I'm sorry, SX-25. I probably should have not joined in the
discussion, as I have some issues with some of what came up.  Enjoy your
net. I'm also into old equipment.

I was at first very disappointed and alarmed by the red-necked responses in this thread, and (may I say at the risk of a further outburst of hostility) what the rest of us in the world have come to expect as typical American arrogant behaviour. But then I was very happy to see a considerable softening of attitude following a particularly poignant posting. The original posting was innocent enough. And a few of the latest have a much more conciliatory tone. I love CW but send it as though with my left foot (as I am told). But someone somewhere has only his left foot to send it with and is grateful enough for that. So live and let live, I say. 73 all.

Yes, that sounds close to what I was picturing. Perhaps a LF oscillator
providing input(s) and a synchronised scope as a readout?

These days I imagine you'd produce a reasonable semblance by knocking up a
two way interface between a sound card and some breadboarded testkit?
Although preferably with a decent linear opto-isolator somewhere in
between :)

A PC makes quite a handy substitute for an audio 'scope. I'm slowly
meandering toward digging up the right 'back to basics' video capture card
to give me something that'll work at lowish RF. (maybe a few MHz) My
lifelong love of the tinkering perpetually exceeds my budget by a couple
of orders of magnitude.. ;-{

Bit expensive for a pass/fail piece of kit I'd have thought. Although, I
s'pose it'd be one of those investments that won't drop in value too
quickly .

Thanks and apols for time-warped reply ;)

Dave J.

Gladly!

If you'll pay the air fare ;-)

Baggage'd cost more than the ticket - it's a lovely old thing but probably weighs more than me..

For that matter, if you'll include my better half, a boat ticket'd do the job <grin>

Dave J.

Well, ship is how we came out here (at full cost I may say). The 6 week line
voyage was a wonderful experience. If I had the money I would gladly ask you
and your wife to bring the tester... but you might pass me going the other
way!

I have a Tono 9000E along its crt1200 monitor produced in 80's by Tono
Corporation Japan and distributed for USA market under the brand name
Drake. My monitor is defective and I need the schematic.

Till a few years ago Tono Corporation had a website (vhf business) now
the company seems to be out of business.
Can anyone give me some information or at least tell me about a
Japanese
forum where I can get help
Thanks

And by the way Dave, I don't think the AVO Mk 4 is all that heavy. What I
call heavy is my old AR88 at 100 lbs (or approx 45 Kilos!).

I am looking for the schematic diagram of the T-368 VFO, model "E".

I downloaded from the web a scanned version of TM11-809-35, but unfortunately the VFO schematic diagram is truncated (all models other than "E" are OK, bad luck) and only a minor part of the VFO diagram is shown.

Does someone have a readable scan of the "E" model VFO diagram? The "E" model is easily identified by the fact that one end of the relay coil is grounded, instead of being connected to one of the 6000 tube filament pins.

The part of the schematic diagram I need is that showing the PTO, the three 6AH6s, the 6000 and its connection to the 4-400A grid.

Thanks in advance for help.

Tony I0JX

After replacing a smaller sensitivity control (in dimension)of the SX100 in
place of the old one which was damaged the stability really much improved
,so it is normal now.
The control is very close to the osc section ,I also fixed the wire running
from this control to the send /rec switich ,which is rather lose
I hope that someone who also has trouble with the stability can use this
hint

At the local antiques flea market yesterday, someone had an old RCA 2-8MHz AM/CW transciever. I'm 80% certain it was model "ETM-25", but it might have been "EMT-25" -- I've spent ten or twenty minutes googling and have found no references to it.

Had a single 807 output and a pair of 807s in the modulator section.

Guy wanted $6000 (~ USD475) for it, and I walked on by.

He said he'll be there next week -- anyone have any data on this radio?

This sounds like it may be Radiomarine equipment. Radiomarine was a division of RCA that provided ship to shore communication and equipment. Many of their models had an ET prefix. The frequencies are about right for marine use especially inland waterways.

The frequency range definitely was a giveaway.

Before the VHF marine band came about, anyone who had a radio
in their boat was in that range (though I gather radio was a lot
less in common use in boats at that point, because of the bulk of
the equipment, because of the cost, and maybe there were more
restrictions in that HF band).

I remember when the deadline to move to SSB in that HF marine band
came along. There was lots of talk about what could be done
with the old AM transceivers, but of course by then there wasn't
that much interest in AM on the HF bands, so it never seemed to
be the windfall that surplus FM rigs in the VHF bands were.

Mike,

You've made some excellent points throughout this thread.

Thanks, too, for your counter opinions. You know, like they say, if two
people agree, one of them
is unnecessary! :)

Please fire up those vintage rigs, Mike. We've got a lot to talk about
besides the weather and how long we've
been hams and I'll look forward to it.

My best, WA9VLK

Yes, that's roughly what I was thinking as I made the post, that as long
as I could bring the lovely lady I'd actually *prefer* to travel that way.

Aircraft seem too much like teleport, no real experience of how far you're
travelling.

>If I had the money I would gladly
>> ask you and your wife to bring the tester... but you might pass me going
>> the other way!

Well, thanks for the thought :-) Her Ladyship has a brother over there and
he seems to prefer it overall. Apparently, the seasons seeming so skewed
is the only main drawback compared to this wet little island.

>And by the way Dave, I don't think the AVO Mk 4 is all that heavy. What I
>call heavy is my old AR88 at 100 lbs (or approx 45 Kilos!).

(Two posts for the price of one :-))

I've just looked it up and yes, that definitely appears to make the grade
as a full-fledged boatanchor!

I wonder what the CR100 weighs in at, it's heavier than the Avo. As an
aside, there seems to be a real commonality of appearance between
equipment from those days. I think it's just the control knobs/switches
plus the slightly yellowing meter movements.

I've just finished checking out what my Dad left me and I've found he or
my Mum binned (yes fricken BINNED) a large green box jam packed with
valves that I remember from my childhood. So I have some spares for the
comms box and nothing else :-((They moved house to much smaller premises
and I guess storage cost outweighed memory. I just wish he'd warned me :(

Real shame as this newsgroup's poked my mind into daydreaming back to
childhood, playing with is it a 6SA7, 6ST7 maybe? Octal double triode
anyhow, along with some sort of 9pin pentode. Built a 7meg crystal oscy, a
couple of different VFOs and a little TRF radio. All with that CR100 sat
in the background to pick up any RF I managed to stick into the air ;)

Ah, one day, one day. I'll get a chunk of workbench set aside for valve
experiments again. Trouble is that I first need a supply of valves. Some
of the above triodes, perhaps a few ecc83s (81s?) some old line-out valves
for some oomph and a 6V6 or two. Yeah, that'd do it... Amongst the
chuck-aways were a couple of 807s too.. :-(</daydream mode>

Dave J.

hello ; i have for sale catalogs from 1970 to 1979

allied , burnstein-applebee , lafayette , radio shack + others

list is too big for here

please go to   www.waltbelsito.4t.com

prices are $ 2 to $ 5 .

first come first serve

prices are not written in stone

please contactme at   wbelsito@aol.com NOT the juno address .

The TM used to be on the military LOGSA website, but after 9-11 that got
locked down severely out of sheer paranoia.

I know that Fair Radio Sales had a lot of those receivers and they probably
have the manuals for them also.

Does anyone in the group have experience with the BFO on the HQ 129X?
I have a warbling on my BFO note. It is bouncing around alittle
continually. I pulled the metal cover under the bfo tube and changed
the wax caps there already. The resistors  and the tube test ok.I have
already recapped the rcvr. Is my next spot to look the BFO can? It
looks like a nightmare to get into. Any suggestions and hints will be
appreciated.  Thanks and 73, Mike KF6KXG

I guess my first post didn't successfully post, so I will try again.
I have recapped my HQ 129X and aligned it. The BFO note varies
continually. I replaced the paper caps in the shield below the BFO
tube. The resistors below the tube and the tube test out okay. Is my
next step to get into the BFO can on top of the chassis? Has anyone in
the group had experience with the BFO on this rcvr? Anyone have any
hints on how to access the BFO can? It looks like they built the rcvr
around it. Thanks, Mike KF6KXG

The schematic for the Solid State LMO is not a Heathkit document so
there is now copyright issue from that end. It is a TRW document and
has been available on the net in the past. Howard should have a copy
of it now.

Jim

Just got this radio, all restored, recapped, etc.  Four tubes and a
```

selenium rectifier. Great sensitivity on the BCB, pulling in tons of
East Coast/Mid-Atlantic Stations from here in South Florida. Never knew
a cheapie could be so fun! Of course, my first radio was a
Hallicrafter's S-120, a real dog, not even as good as this Knight radio.
About the same as my S-38C in performance. Retro-listening is where it's
at.

Are you sure its the BFO warbling and not the local oscillator?

What sort of antenna did you use on the Hallicrafters receivers. The Star Roamer has a built in loop and may well have done better than a short wire antenna on the others.

The Star Roamer is the same basic configuration as the S-38 series and the S-120. There is no good reason why the Star Roamer should be significantly better than either.

For minimalists, I like the regenerative sets. Super-gainers (super-het with regenerative if stage) can be quite good, altough there are not many examples - and a few that were sold were cheaply made.

Simple rigs can be fun to use.

One note - using a simple receiver with one tuned stage, a long antenna can allow the receiver to overload badly, especially by broadcast stations. In that case, a short Hi-Q antenna (a loopstic), can significantly improve reception.

Congratulations on restoring the receiver.

73, Colin

When I got the S-120, I made my mother mad by climbing on her shake-
shingle roof and installing a long wire, from one peak to the next, about
50 feet, and about 15 feet up.  This was in the mid 60s when I was in
high school.  You are right, the Knight has the built in loop on the
cardboard back, and I use a Select-Tenna to help it out.  The S-120 could
barely pull in the "big" players back in the day, BBC, Radio China, Radio
Moscow, DW, etc.  On BCB, an old 5 tube AM table radio could beat it
out!  My long wire, then, ran NW/SE.  My wire now, that I have connected
to the Knight and my other boatanchors, is about 20 feet and runs NE/SW,
I am only one mile from the Atlantic here in South Florida.

For some reason the old S-38 and the Knight are more sensitive than the S-120 was. I have never heard any good things from people who had the S-120, most said it was deaf as a post! My mother got it from Sears on layaway(does that date me?). I think it was $69.95, or some such. What did I know then? I do know that it was very inaccurate, not very sensitive nor selective, and basically a dog. My dad in the AF later got me a surplus R-390 from a comm squadron that was scrapping them, and then I found out what SW/BCB was really like! Unfortunately, it was an aircraft model, that required a 28 volt power supply to go along with the radio. When I turned it on, the lights in the house dimmed!

I had a Heath GR-54, which was a bit better design than the Star Roamer.
    It worked ok on the lower bands, but on the highest frequency band
```

it didn't get much besides TV birdies.
   I almost bought an SP600 when a surplus store on Canal Street in
lower Manhattan got a truck load of them in and was selling them cheap.
  The major reason I didn't buy one was that it was too heavy to carry
home on the subway. (Now if I had thought ahead and brought a hand
truck with me.... assuming I would have been allowed to bring one on the
subway). Then again I wonder how hard those things are to restore.

If it varies the same amount on all bands then it is the bfo.
If it varies more on higher frequencies than it is the vfo.

That sounds like an R-392, which is a great radio but different than
the R-390.

If you have another general coverage RX, or even a broadcast RX you can hear the LO on it. If the LO isn't stable you will hear it. I've never worked on an HQ-129X so I can't help with mechanical details. However, I have run into bad silvered mica caps in SP-600 receivers, in the BFO, 5mhz IF (both 51 pf silver micas) and in the LO modules. The symptom of the IF cap is that it changes the tuning after it warms up. The ones in the oscillators either warble or jump.

Thank you Richard and Kenneth. I found a questionable solder joint I
resoldered it and it improved things a bit. I put it back in the
cabinet for now, some other time demands came up. I will probably dive
back into it in a month or two and check the silver micas in the
oscillator first. Thanks for the information. Mike KF6KXG

I got a Hallicrafters S-120A, which was transistorized, in the summer of
1971 when I was 11. How horrible that radio was.

But the next year, when I got the use of an SP-600, my first thought
was "boy is that noisy". I was too young to realize that it wasn't that
the S-120A was "quiet", but that it was pretty much lacking in gain,
and that's why there was no real noise coming out of the receiver.

I paid $80 or $90 Canadian for it then, the cheapest new receiver
I could get, and really pretty useless (as I've said before, it
had all the disadvantages of the low end tube receivers, plus
all the faults of a badly designed solid state receiver).

I got a Grundig G4000 (a Yachtboy 400 under a different model number) for a hundred dollars in October, and got a free windup radio as a bonus. An actual frequency readout that means something, double conversion, a decent BFO (I can actually receive SSB signals with it, I couldn't on the S-120A unless I drastically attenuated the incoming signals), surely better selectivity, and so much more sensitivity. No tuning knob, though.

SP-600s are, in general. not too hard to work on and use mostly standard parts. There are some difficult areas, for instance if you have to take the tuning unit apart but this is mostly not necessary. There are a lot of parts because something like twenty five thousand of them were built. They worked very well when new and can be brought back to this performance. I have come to the conclusion that there are a lot of SP-600ds which work but are really sick. I read complaints of poor RF tracking, poor dial calibration, etc, all signs of misalignment or tampering such as plate bending on the tuning capacitor.

So that would be the in aircraft model?  My mom made me get rid of that
monster, not only did it consume huge amounts of power, but it left deep
marks on her carpet that can still be seen to this day!  Cut the rug all
the way to the concrete!

Is there a 651S-1 mod that retains the last listening frequency when
the radio is turned off?  Now I get ".0000" each time I turn the radio
on, regardless of what frequency I was tuned to when I turned it off.
A youtube video shows the radio coming up tuned to 20 meters when it
is turned on: how is this implemented?

I added a 6 VDC source to the terminal strip on the back, and that
retains the frequency when I unplug the radio, but when I turn it off
using the power switch it still comes up .0000 when I next turn it on.

From the website, http://www.collinsmuseum.com/651s1.html:

"FREQUENCY MEMORY KEEP-ALIVE POWER
Used to maintain storage of frequency information during power interruptions. An external 6- to 8-volt battery supplies the necessary power for the circuit. This option is implemented by wiring the special keep-alive assembly into the chassis subassembly. Refer to the configuration chart for status numbers of receivers that include this option and for the part number of the chassis subassembly that includes the special keep-alive power assembly."

That's the skinny. We used a rack of four of them at the U.S. Embassy
in Guinea-Bissau in 1987-89. Each had been modified by having its blue
fluorescent displays replaced with LEDs. The receivers each had had a
6-volt gel cell. All the gear was replaced by Harris equipment shortly
after I left in September, 1989 and was replaced by Harris equipment.

Do a google search and see if it looks like what you had.  It's a weird
machine.... 28V plates on most stages, but actually a good performer.
It was used in aircraft as well as in ground vehicles.

Hmmm; so with the 6 VDC source connected, when I turn off the power
switch, and turn in back on, I should see the same frequency displayed
as when I turned it off? I'm not seeing this behavior with my radio;
if I unplug the power cord from the wall, and plug it back in, this is
the way it works, but if I cycle the power using the panel mounted
switch, I get ".0000".

Hmmm; so with the 6 VDC source connected, when I turn off
the power

switch, and turn in back on, I should see the same frequency
displayed
as when I turned it off? I'm not seeing this behavior with
my radio;
if I unplug the power cord from the wall, and plug it back
in, this is
the way it works, but if I cycle the power using the panel
mounted
switch, I get ".0000".

   I am not at all familiar with this receiver but is it
possible that the power switch is also a reset switch? If it
is perhaps its possible to disable the reset function.

That sounds normal to me. We left our receivers on 24/7 and the battery
just kept the thing from doing going to .0000 if the commercial power
failed--and it did that quite often. We had no automatic changeover to
generator power and had to go into a generator room and manually fire up
the 40 KVA generator. It would have been ugly to have to retune the
receivers after all that.

Hi, Gang

One of the eBay sellers has posted photos of the internals
of the Collins 51S-1 receiver. This is the general coverage
version of the Collins S/Line. The band switch
is especially interesting, sort of a turret arrangement
where the switched components, mounted on pc-board material,
revolve with the band switch.

E-bay item number 400087645664

73,
Ed Knobloch

If you go here:

http://www.youtube.com/watch?v=3D708FBf6t87c

the operator turns the radio on, and it comes up at 14.000 MHz. So
apparently is is possible for the receiver to remember the last-tuned
frequency when turned off/on using the power switch. The question is,
how?

Perhaps a clue will be provided by the service manual, which I'm
trying to locate. $urplus $ales of Nebraska has one, but they're
asking in my opinion too much money. There is also a service bulletin
(which I have) that addresses a "frequency keep-alive" modification,
but I'm reluctant to tear into the radio to the degree required to
implement the modification until I have a manual/schematic. The
language in the bulletin is somewhat terse and I'm not even sure this
mod will give the behavior I seek.

I like Richard's idea: I'll get the Service bulletin out and
paraphrase it here. Perhaps the mod does indeed defeat some sort of
power-up CPU reset...

Knowing that boatanchors collectors usually like equipment as intact as possible, I invite comments on the general interest for getting a radio that has been fully disassembled and re-assembled, and without its original cabinet.

Hi gang,

I'm looking for the schematic of the old Archer "Space Patrol" walkie talkie or similar. I think this tpye all used a very similar circuit with a superregenerative rx that used the same stage as a non-crystal controlled oscillator on tx along with a 2(?) stage audio amp.

Any help?

Tnx

Bob WB0POQ

A lot of companies in Japan made these things, and they all copied one
another in much the way Chinese manufacturers do today.

Here's a typical design:
http://yb3td.com/data/walkietalkie.html

As I recall, the Archers that I had as a kid were crystal-controlled for
transmit but used an adjustable LC network for receive tuning. I remember
moving one to 10M at one point but the audio quality was very bad and of
course there was no squelch...

Hi Scott,
Thanks for the response. I found that site a few days ago, and was playing around trying to get that circuit to work, until I noticed that there is no DC path for collector current for Q1.
Also, there seems to be an issue with how L1 and L2 and the associated caps are connected. I moved a few things around and got Q1 to work as an oscillator and a superregen detector (I think), but have not built up the audio and the switching circuits yet.
I'm still hoping to find some other examples of these cute little rigs. :)

Hmm... you're right, that's really creepy. You think maybe base and collector
are swapped here?

I was thinking at first that maybe the base leakage did the trick, which
could be possible if it's a germanium type.

I can send you a Lafayette one if I can find it. You're welcome to draw the
schematic out.

Scott,

  I don't think the base and collector are swapped as the biasing looks
right as drawn on the presumed base, plus, if so then there would be no path
for base current. ;) ;)
Thanks for the offer of the Lafayette, I'd love to get a look at it.

Bob

Give me an address and I will mail it.  Your email in your post is not
valid.

Looking inside it, it looks way higher quality than the Archer.  It has two
transformers inside!
--scott

I will say, though, that the RF performance on the Teenage Mutant Ninja
Turtle 49 Mhz walkie-talkie when moved to 6M is much better than on the
Archer Space Cadet walkie-talkie when moved to 10M.  Either one is really
fun to write on a QSL card, though.

I think you're right, the circuits were so simple that there wasn't much
variation.  Any schematic, I suspect they are in the RCA transistor guides
among other places) would make a good start for circuit tracing.  You have
an end circuit to visualize and use the actual circuitry to "test" the
schematic, either it's going to match or be close.

     This turns out to be as much a promotional booklet as
an intstruction book. High res and worth the trouble to
download.
     Thanks for posting the link.

Hello,
anybody in BA land has an inside tags of a JX-21?
```

```
I'm restoring a magnificient SP-600 without tags, may be there is someone
capable to reproduce it... any suggestion?
Thank you in advance.
Cheers
Claudio

I recently got a second Henry 2K RF Deck that is an improvement over my
older version as it has the separate 80 and 75 positions on the band switch.

The problem is my new band switch is very stiff and won't turn without great
effort. In the original Henry 2K series the band switch in the center of
the front panel uses metal dial string to turn three different switches.

Does anyone have an idea of how to loosen this up? My old deck has a broken
hub but was never too difficult to switch.

Have you tried Cailube?

You may want to try a light turbine oil on the sleeve the shaft passes
through, once you have cleaned the whole thing up with Cailube.

David Thompson <thompson@mindspring.com> wrote:
>
>Where do you get cailube? Is it lithium based?

Calube is a contact cleaner with a small amount of lubricant in it. It is made by Caig Labs. I buy it from a local electronics retailer, Cain Electronics, but you can probably get it from MCM or Parts Express or Digi-Key.

It's probably just oleic acid in with some petroleum... it leaves behind a light film on contacts that is mildly reducing and keeps contacts clean, while also providing a small amount of lubrication. It's really a cleaning product that happens to lubricate a little rather than a serious lubricating oil.

Lithium salt-based greases are going to be way too thick for the mechanism you're dealing with, unless you see something that is already greased. Stick with the light machine oil on the dial string pulleys and shafts.

Ack are really good folks, they were always a huge help to me when I was a starving student at W4AQL. I'm glad to hear they are still around.   The thing about Cailube is that it is a contact cleaner... it reduces corrosion and it's okay at high voltages.

With the lube spray, be careful with it because it may not be okay to get on the contacts themselves. If it's something like Superlube by Loctite, it's also pretty thick once it dries and you may want a lighter oil than that.

Ace Hardware will carry Zoom-Spout Oil which is a light machine oil that will work really well on the pulleys and the shaft. Or ask Ack if they have a "10W turbine oil" or an "ISO 32 turbine oil." It's thicker than sewing machine oil but thinner than medium machine oil.

Great Scott,

I will check on your recommendations. Tommy Ack retired several years ago
and suddenly became a SK. Another family member runs Ack now but he is not
a ham. I knew Ack W4ECI who actually started Ack in Birmingham in 1946. He
has been a SK for a long time.

Guess you knew Sandy W4RU (ex WA4ABY) became a SK recently. I hear from
Dave K0DI
from time to time. I gave a talk to the club in the early 1990's on
contests and log checking. It was still mostly hand checking even that late
although
we were already defining uniques, busts, and not in log.

Thanks for the help.

i have a new list of the catalogs , too big for here

please go to www.waltbelsito.4t.com

prices are not written in stone .

make me an offer .

i want to sell these catalogs .
```

thanks   WALT , waterbury , ct .

If you mean by tag the label in the radio the only one I know about is the label on top of the tuning capacitor cover. This has the model number and serial number on it. There are no other labels on the set other than a contract number plate on the front panel of some military sets.

There may be someone making replacement labels, searching around all the SP-600 sites will find them but I suspect no one is doing it.

If you have to remove the tuning capacitor it has a number on the side which I believe to be the serial number.

Yes Richard, I mean that label.
I was looking for someone who reproduce it.
Thank you for your suggestions.
Cheers
Claudio

    Try James Moorer, he does not make labels but restores a
lot of SP-600s and may know of a source.
    BTW, the tuning capacitors have a number stamped on the
side which may be the original serial number of the set. I
am not sure of this but think it is the case.

Looks like it is the RF deck from a receiver...perhaps the Mohawk.

I have an RME RF pre-amp that uses 3 tuned RF stages to boost the signal
and this thing looks like it might serve the same purpose. All I see is
tuned circuits and tubes. It should be interesting to know what it
really is.

Should be a part number rubber stamped somewhere on the assembly. If
so, check it to an assembly manual for the Mohawk.

Why is the meter 'zeroed' against the right peg, is it broken?
Or did National design it that way because they had a backwards meter
circuit that pulled full current with zero signal?

This is a backward meter by National.   The meter deflects left when current flows.

It's the front end to an RX-1 Mohawk receiver. They were supplied with the kit pre-assembled.

The radio must have had a backwards meter amplifier then.  Weird.
Guess one could design a proper solid state amplifier to make it work,
but you'd have to 'zero' the meter at full scale with no signal.

hello
Can I use a universal power transformer out of a hallicrafters S-40 AU into
an SX -100 ? The power consumption of the S-40 is less than that of the
```

SX-100 so I am afraid that is getting to hot or could it deliver the extra
watts ?
Thanks in advance
hans

Hello Hans:

Using a power transformer from a set that consumes less power can be an invitation to failure -but it can be done if there is no other option.

In most receivers, the voltage out is similar. The problem for a transformer is that when the load increase beyond design, heat will rise. Most receivers are already pretty warm inside.

Compare the total power consumed by the two transformers in their respective receivers. If the replacement power transformer is something like 15% less power, it can be a candidate for swapping. But, there are a couple of things I would do. First, replace the rectifier tube with a solid state version (including resistors to drop voltage equal to the drop by the rectifier tube. Secondly, use a variac to keep the line voltage down to 110 vac (or 220 in Europe). Third, ad a small muffin fan to remove heat from the radio.

Of course using a proper transformer is the best solution - but sometimes it is necessary to improvise. The SX-100 is a much more valuable receiver, however, and inserting a transformer from an S-40 will decrease the value. You might be able to find a transformer from a SX100 or SX-96, which would be a better solution.

Many years ago, I oten did things like that because that was all that was available.

Good luck, Colin K7FM

If you don't use the filament windings from the smaller transformer and
power the tube filaments from an added filament transformer this will
reduce the load on the smaller unit. If the set used a rectifier tube
with a 5v filament either provide a second external filament transformer
for that or replace the tube with silicon diodes.

It will get hotter than it gets now. Assuming the output voltages are the same as the one you're replacing, it'll get hotter as the square of the current rise.

You say it's a "universal power transformer" -- does that mean that it's not what originally came in the S-40? If it isn't original, is it specified heavy enough to go into the SX-100?

If you're inspiration limited rather than money limited, Antique Electronics Supply has power transformers -- they ought to have something that'll work, and may even have something that'll fit. http://www.tubesandmore.com.

Odds are it's a generic power meter.... directional coupler, rectifier,
filter and meter.  The fancy part is the directional coupler.

There's a schematic for a very similar design in the older ARRL Handbooks,
or you can look at this:
http://www.qsl.net/n9zia/wireless/pics/dircoup.png

Odds are the RS one uses the same meter for both strips with a switch,
to save costs.

Check these guys out: http://www.oldradioparts.com/
They have lots of new, used, and surplus power transformers for radios
at good prices.  Note that they don't update the web page inventory too
often so email them to ask if the unit you want is still in stock and
give several alternates.  They give quick service, I've bought stuff
there before.

I guess the meter will drift to the right when power is applied to the
radio with no signal.

Weird. I'm going to have to find the schematic to the HRO and figure it
out.

I meant drift to the LEFT when power is applied.
```

it has a meter with the zero on the left.

The AR88 had also a meter with the zero left (when there was a
meter anyway, because many had no meter at all)
It measured the cathode current of one of the IF tubes. (Less
amplification/cathode current means more signal). That leads to
the
somewhat odd 'zero right' configuration

I found the schematic for an early HRO
(http://www.portabletubes.co.uk/sitefiles/hro1259.djvu), it seems the s
meter is in series with the plate circuit of the last IF stage, so it

```
measures the plate current.  At maximum signal the plate current of that
stage must be close to zero to send the meter to the 60 over nine position.

I think universal power transformer simply means it is a transformer
designed for both 120 and 240. Purchasing a Hallicrafters with such a
transformer was available for users in the rest of the world.

Oh, _that_ kind of universal.

hello
Many thanks for all your kind reactions
My only question was if I could use the universal power transformer out of a

not used S-40 AU into a SX-100 to make the SX-100 all hallicrafters again .
It is now working very good with a non hallicrafters transformer
I decided not to change anything at all because the risk that something goes wrong is to great
thanks again
hans

I have a Heathkit SB-610 monitor scope that I refurbished a few months
back. I connected it to my SB-301 receiver by tapping the secondary of
its last intermediate frequency (IF) transformer (T4 in the 301's
schematic) using a 1pf capacitor and RG62 cable as recommended in the

610's manual. After adjusting (=93peaking=94) the receiver IF transformer and the coils in SB-610, the scope worked, but the trace didn=92t have much vertical deflection, even with the 610=92s vertical gain control fully rotated clockwise.

My remedy for the small trace was to build a tuned pre-amplifier using a 2N3904 transistor. The extra 20dB of gain it provides produces a trace that=92s about 1 inch high for an S9 signal and the vertical gain control at 12 o=92clock. All is well.

So here=92s my question: Building the pre-amp was a fun and useful project, but is my scope=92s performance without the pre-amp typical?

I have one of those...And yeah, sounds like your gain is down a bit from normal.

Hi David:

It is hard to tell from the facts you gave us. It might be useful to feed a signal generator into the scope and compare to factory specifications. The 1 pf coupling capacitor could be less capacitance, and simply let less signal through. Or, your RG-62 could be lossier that expected.

I assume the input to the SB-610 is properly tuned to the correct frequency, since there were different "front ends" available for the SB-610. If the front end is not tuned properly, then the indications of the SB-610 will be misleading, even though you have increased the gain.

73, Colin K7FM

No. Something is wrong. With the gain control set halfway, S9 signals go way over the top of the CRT with my Collins R-390. This is using log scale, too.

If your problem is the same in both linear and log, that's one thing to rule out.

Colin,

Thanks for the reply.

I had to wind my own coils for the grid and plate tank circuits of the
SB-610=92s vertical amplifier that=92s based on a 6EW6 tube. The tank
circuits are peaked at 3.395 Mhz, the IF frequency of the SB-301. I
used no. 30 magnet wire and ferrite slugs from what were probably 455
Khz IF cans littering my junk box. I suppose these coils could have

less Q than what the original Heathkit coils had, but I doubt it.

So, yes, the =93front end=94 is properly tuned and the RG-62 patch cables are constructed from stock coax I=92ve used in other applications without trouble.

Maybe the SB-301 IF strip has less gain than usual, but the receiver doesn=92t seem to be insensitive. One remedy might be to use a coupling capacitor larger than 1pF, as you suggest, but I calculate that this will make little difference, as the SB-610=92s input impedance is 100K Ohms.

Perhaps I should ask a different question: For an S9 signal and the vertical gain control set to 12 o=92clock, what=92s the height of the trace on your SB-610?

Scott,

The SB-610, which is crude oscilloscope, doesn't have a log scale.
Are you confusing it with the SB-620 pan adapter ("Scanalyzer") which
presents a frequency domain view of signals?

It is possible that the powder used at 455 kHz is quite lossy at 3.395 MHz. Usually, a quick and dirty way to tell is if the peak is sharp. The broader the peak, the lower the Q.

Will try to get my manual out to review it for clues. I suspect your SB-610 sensitivity is below par.

Colin,

Regarding the possible low Q, the pre-amp has the same tank circuit as
the 6EW6 grid circuit: a 330 pF cap in parallel with a 6.7 uH coil.
The coil is comprised of about 25 turns. When I bench tested the pre-
amp, I recall computing a Q of 30 for the tank circuit. These seemed
reasonable at the time, although your explanation about the lossy core
material plausible.

Your help is much appreciated. Let me know what you think.

Dave-

What do you mean by "tapping"?  If you did not connect the 1pf capacitor
to the top of the coil, then that may be causing your reduced signal.

Fred,

Sorry for using misleading terminology. I did just what you suggest--
I connected the 1pF cap to the top of the IF transformer's secondary
coil.

Hi all,

I just begun restoring the SP-210-LX (guessed model from the bands,
there's no model name in the back plate). One of the previous owners had
the "brilliant" idea to include the power supply transformers into the
main chassis and removed the last AF (push-pull) amplifier stage tubes,
T-7 and T-8 to make some room.
Is there any hope to find these two transformers? Maybe someone has a
part unit?
Is there any data available about T-7 and T-8 so I can try to make
replacements?
Thanks in advance and season greetings!

Frank IZ8DWF   (<mycall> at amsat dot org)

Not sure one can understand the dilemma!
Lets say the meter is typically in the plate circuit of one or several
RF or IF amplifying tubes.
When the set is active and with no signal, the meter deflects (from
right to left). That type of meter is often called a 'Right zero'
meter).
When a signal is received a negative AVC voltage is generated; applied
to the grid circuits of the amplifying tubes their plate current is
reduced. The stronger the signal the greater the AVC voltage and ergo
the greater the reduction in plate current.

Hence the meter swings towards the right (or zero) in proportion to
the strength of the received signal.

Hello Frank:

The push-pull output transformers should be fairly common and easy to
obtain. Antique Electronic Supply, in USA, is a good source. As I recall,
the output tubes are 6V6s, so that would use a common transformer as well as
driver transformer.

73, Colin K7FM

actually the output tubes and the driver are all 6F6. Also the output
audio impedance of the SP-200 series is 600 ohms, I wouldn't mind too
much to have directly an output impedance for driving a 4-8 ohm
speaker, but my first option would be restoring the set as much as
possible close to the original. I'd be happy to find any information
about the transformers, like power, turn ratios and so on.

The 6V6 and 6F6 is pretty much interchangeable, so the standard output
transformer should work. 500 ohms is not a common output today, although
the pp 6V6 to line output may get you in the ball park. It should use a
standard interstage transformer.

A push-pull old Hallicrafters transformer would work, since they had a 500
ohm output, too. SX-28, SX-62 and SX-42 all would have the right
transformer if you can find one being parted out.

I recognize it; it's definitely the Mohawk factory-assembled RF / VFO
section.

The 6F6 tubes are connected as triodes and operated nearly at Class-B, the output transformer is 10,000 plate to plate. This is a common impedance. The original transformers have a 500 ohm main output and a loosely coupled 8,000 ohm winding for the headphones.

David-

Might the signal level be higher on the primary side, assuming the 1pf
capacitor can withstand the voltage?

Hi Gang:

This is a brand new CRT for a small scope. It is new in the box with
original packing and documentation.
I don't need it as I don't have the scope. $25.00 plus shipping.

If interested please reply by e-mail.

Thanks and 73,

Michael, W1RC

Partial success on this stubborn problem and it would have to be my favorite rcvr too. I traced the thunderstorm crashing sounds down to the 2nd converter subchassis. After I pulled it again, I replaced all the caps and the resistors since it is such a pain to access. I powered it up on test leads to the main chassis and still heard the frying thunderstorms. A 22k resistor that I replaced was starting to overheat and turned brown. I checked the one I took out and it too was burned looking. So.... I need help on what would cause the overheated resistor (R24). I can email a schematic to anyone who can help me out on this. I double checked all wiring and parts were replaced one at a time. Help. Thanks ahead of time. 73 Mike KF6KXG

Based on you other posts, I don't think you found the source of the problem, only another symptom. If the noise stopped when you pulled the tube/tubes, Did you try pulling them to stop the resistor overheating? Replace the tube/tubes with a different set, one at time. Watch the resistor for overheating, again.

If you have indeed replaced all other components, the one you have not commented on are the tubes. Sounds like a grid to plate short somewhere.

I have no familiarity with that receiver.

Paul, I tested the tubes and they seemed to be okay. I will try your
suggestions. Much appreciated, MIke KF6KXG

Have you made tube socket voltage and resistance measurements? This is a first step and will often point at problems. I've downloaded the schematics for both versions of the RX, you appear to have the earlier one (the 22K resistor is a different value in the later version). I can't see an immediate suspect but any capacitor in a position to draw current through the resistor is a suspect. While paper caps fail mostly by developing a low series resistance I have encountered shorted ones.

Both the Mark 1 and Mark 2 models have the 22K resistor in the Bama
schematics. I would check
both C24 and C26 but a leaky C24 is the most likely cause of overheating
in the 22K resistor. A
quick check on the plate and screen voltages of V5 should point you in
the right direction. A tube
socket extender is handy here, but carefully pulling the tube out and
carefully wrapping a fine wire
around the appropriate pins and plugging it back in will work. C28, C29,
and C30 should also be
checked. Silver migration in C28 and C29 could conceivably case the
noise too.

Something is drawing excess curretn through R24. You said you replaced the caps in the sub-chassis, but that circuit appears to be the offending circuit. I cannot quite read component numbers, but if noise appeared on the screen bypass cap, it would be more likely to make the crackling noise than a bypass cap further up the power supply chain. And, as Barry mentioned, the coupling caps for that if transformer could be bad, particularly C30.

Varying the selectivity control will change the load on C28 and C29, so you might see if there is any change. It could also be one of those caps or the rotary switch, although having the crashes go away when pulling V5 along with overheating R24, points to the plate or screen of V5.

Check C27, the plate bypass cap, closely. That is a tuning cap and would have some affect. Noise can be caused by a cold solder joint, but that would not result in more current being drawn.

You are getting closer.

73,   Colin K7FM

Looks like a different value to me but both schematics
are sort of low res.

Looked again. Both are indeed 22K, I don't know why I
saw one as larger. I agree that C-24 looks suspicious.

Success! Yes! Thank you everybody for all the help. Because of the location of V5 in a TIGHT corner of the subchassis I didn't check its voltages until I used lots of test leads and fired it up on the bench out of the rcvr. Not only was the screen grid reading low but so was the plate. It should have been around 270v and was only 17! So after making sure there were no shorts on selectivity switch circuit off the screen grid I focused on the plate circuit. The only component I hadn't changed yesterday was a 100 pf tubular ceramic cap that ohmed out in the megs. Silly me, I thought it was good. Well it was the first component to ground after the plate so....I decided to lift a lead just to be sure. Wow, everything went to normal voltages and the crackling stopped. I subbed in a new ceramic cap and let it run for a while on the bench. All was good so I put it back together and aligned it. Colin, you were dead on. It was C 27. I just figure the cap was partly open and under high voltage, broke down to a short that varied in degree that caused the thunderstorms. While I also replaced V5, V12, and V13 in case of a grid to plate short as Paul suggested, my Paco tube tester did not indicate any shorted elements, but then again I am going to check them with an VOM when I get a chance just to know. Barry, I had the same thought on silver migration, so the first thing I did was to change the silver micas.

Again, thank you to all who helped to point me in the right direction. Sometimes we get so close to a problem, we miss it and another person viewpoint is needed. Have a great weekend, 73 Mike KF6KXG

And of course, while all this is going on, be careful that you are not hearing *genuine* static crashes that will mask the cure! Eliminate that possibility by listening on another receiver (with yours off).

Hi folks,
I have a wonderful Collins 2050, everythink works well less the RF gain.
BITE say the pot does not work correctly = always zero.

Any suggestion?

Cheers

Claudio

In the right quarters, those valve testers are quite highly prized.
Very, very few 'ordinary' UK radio amateurs would be interested - unless
they had an interest in vintage equipment. The BVWS seems by far the
place to ask.
--
Ian

For years 3546 has served us vintage equipment aficianados well. Unfortunately, largely due to their robbing us CW ops of most of our exclusive 80 M spectrum, the middle portion of the band has filled with nets and hams who seem only interested in collecting the membership numbers of other members trivial little clubs. Very often the equipment we are using is frail and low in power so we can't compete up against the Kensues and YaeCOMs not to mention the gaggle of contester super ops that seem to own no receivers. Although I appreciate every QSO, I must admit it is always more fun when I am told the other station is using vintage gear. I am suggesting we boatanchor enthusiasts move far away from the crowd and start using 3599 kc. Calling "CQ," "CQ BA" or just "BA" would alert this otherwise quiet frequency that someone is there who is running fun gear to hear. Comments?

See you on 3599?

Great idea! Only one comment that is not really worth mentioning but
nevertheless: "Why restrict it to just one freq? What's wrong with a
band from 3560 to 3599?" This would give less qrm on one freq. 73,
John K4ZYF : ps: hallicrafters sx-117 & ht-44 here, solely cw.

That's a great idea John. My preference would be a segment of the band for the very reason you cited. Unfortunately "they" didn't leave us CW ops very much to work with so I thought setting a so-called "calling frequency" as a place to monitor would initiate the activity and then additional stations hearing the activity could plop down above and below the 3599 frequency. But, SURE! I am "crystalled up" with many frequencies between 3560 to 3599 but unfortunately it doesn't seem that portion of the band has developed any "identity" as a vintage equipment spot.

Last night I listened all evening on 3599. I only heard one signal, a VE2. I was otherwise engaged so i could not go back to him to find out of he was

responding to the posting and using vintage gear. I am leaving my NC-303 on
3599
when I am in the shack and am hoping the idea catches on.

3546 was once a good calling frequency and it was reasonably populated with
vintage stations. But unfortunately it has become swamped with guys looking
for a sliver of spectrum ever since "they" robbed CW ops of their spectrum.
Meanwhile 3600 to 3700 sets quiet, populated by (at most) 2 or 3 QSOs in a
given evening. Brilliant idea.

QTX es 73 WA9VLK

Why do you think that you must stick to 3500 to 3600 khz.  Last I
looked, cw was permited from 3500 to 4000 khz.  Why not use 3600 to
3625 khz?  It is virtually dead here on the West Coast.  I have found
that 7100 to 7125 khz is a great place to work cw on 40 meters,
especially with my rock bound boatanchors.  There is no reason not to
do the same for 80 meters.

Have you still got it? I had one of these in the 60's but had to part
with it. Although I'm now in my eighties I still do some work with
valves and would love such an instrument. I live in Mid
Wales.(Llanidloes)

You are so right, Tim. If you do a search on this reflector you will see that I initiated (what became) a heated thread over a year ago about that very fact. There is no reason whatsoever that CW ops should not be using the space above 3600. In fact, I believe one of my tirades went so far as suggest we CW ops start using the traditional phone spectrum above 3800 for CW. Why not? It's legal and they took our spectrum so why shouldn't we exercise our prerogative to use spectrum where we're not jammed in elbow-to-elbow?

The purpose of my most recent posting, however, was just to try to establish some common spot where vintage enthusiasts might listen with the hope of finding someone running something other than Kensues or YaeCOMs. Maybe they'll even be able to have something to talk about other than "RST QTH NAME WX AGE and BEEN HAM..YRS" before saying 73.

One can dream, anyway.

I like using crystal control in some of my rigs and having a small band where rock bound cw rigs can flourish will do wonders to get them on the air. Vfos are also fine, but tuning + or - a few khz might be rewarding.

What a joy to fire up an old BA after grinding a crystal. We can grind numerous crystals to the small window, to allow us to QSY.

Just restored an old crystal controlled Handbook rig, using a 6DQ6B.

There are several great ideas mentioned other than mine. I really
didn't think I should have said it but now glad I did. With respect
to rock controlled rigs. One on the greatest things I recall from
my novice days was when I worked a station as a novice on 40 mtrs cw,
in the evening time
with an old globe chief with crystals control and a hallicrafters
rcvr (cannot recall the model), from Greensboro, NC to Seaside, Org.
during the busiest time of the evening around 2000 hrs local (8 PM
EST). The QRM was terrific and we had a long QSO.
Nuff said, John K4ZYF

> John K4ZYF : ps: hallicrafters sx-117 & ht-44 here, solely cw.

You know DDS chips have become so cheap that it's possible to build a
three chip solution (DDS, uC, and buffer amp) that will replace ANY rock
from 1.8-7.3 MHZ. OK, it's not vintage and more power to the guys that
can re-grind old FT243 rocks to change frequency. But with technology
changes some of our old rigs now might need outboard help, like those
who restore vintage TV sets now need to use set top boxes to get reception.

You are so right about the canned qso's. I have found that a
boatanchor transmitter is the best ice breaker for getting a rag chew
going. Now if we could just get DX stations to carry on a qso of more
than 15 seconds...

A side comment - as bad as some canned cw qso's are, PSK-31 is much
worse. I stopped using PSK-31 when I finally go around to configuring
my PSK-31 software and realized my qso was reduced to clicking three
different buttons.

Don't know where you are (or even your call) but here on the East
coast 80M is only crowded on contest weekends.

I think you just might be complaining about the FOC event last
```

weekend, with your reference to numbers and such. Maybe you'd
appreciate googling "Second Class Operators Club" :-). http://www.qsl.net/s=
oc/

On storm-free winter evenings 80M is a joy. Only problem IMHO is lack
of activity - seems to be the opposite of what you're complaining
about! Again, everything will be hopeless on a contest weekend. Well,
not completely hopeless, I did the NAQP and CQ WW DX with my HW-16
just two or three years ago.

Rather common for me to find (while I'm using my HW-16) others with
boatanchors, other Heaths, some Hammarlund and Hallicrafters and Eico,
and a smattering of homebrew tube rigs

3599 is an awkward frequency for the rock-bound BA users who probably
don't have a crystal there.

Tim N3QE

What "exclusive spectrum"? We share all of the non-phone parts of the
HF bands with data modes.

> Very often the equipment we are using is

Everybody with a license that isn't doing emergency comms has the same
rights to a frequency. The contesters, traffic handlers, RTTY ops etc.
are all part of the game.

I suggest a little bit lower, say 3597 or 3598, so we don't stray into
the Extra 'fone band.

But as N3QE points out, most of the time here on the East Coast
there's plenty of room on 80 CW.

I'm guessing that 80M CW is even more depopulated in the rest of US. And I do know that during the big CW contests, that the PSK31'ers and RTTY'ers will move way up to the 3580/3590 region. My gut feeling is to simply write off the CW contest weekends as a good time for casual QSO's. And besides, I like running in the contests too, no way I'm gonna win, but it's fun.

I used to "defect" from my 40M stomping grounds to 80M mostly as a way avoiding the international broadcaster QRM but 40M isn't so bad lately thanks to the rule changes. 80M can be really sweet in the winter though!

Tim N3QE

SX-

I don't currently have a Boat Anchor rig on the air, but have been listening for the last few days on 3599. It certainly is a quiet frequency. I haven't heard any signals at all near there.

The band is definitely not dead in the evenings. W1AW code practice comes through loud and clear. I often hear traffic nets with good signals within a couple hundred miles.

Every evening after 1900 Hrs, ( 7 PM est), I have been listening and
calling cq with my old
gear.  Not right on 3599 but just below it. Haven't heard anyone call
me or call cq.  My old
SX-117 hears other signals , maybe I'm just hard of hearing.

John,

I'm there but 80 meters has been awfully wicked the last week. After 0100 GMT it seems to go from strong, consistent signals to fluttery mediocre signals. I too have been calling CQ on 3599 like a cat wanting its supper with no success. Since my posting I have left 3599 on and monitored it (on vintage gear of course) while I do other things but so far it seems to be a wasted effort.

Indeed I am listening for you and anyone else interested in trying to establish a "loosey-goosey" vintage gear calling frequency.

Hope you and yours enjoy a safe and happy Thanksgiving.

I guess you are likewise most happy to have SSB in "your" CW segment?

The band segments are gentlemens agreements. Be a gentleman. I find the
agreement to be helpful, not a bad thing at all.

> The purpose of my most recent posting, however, was just to try to
> establish some common spot where vintage enthusiasts might listen with

> the hope of finding someone running something other than Kensues or
> YaeCOMs. Maybe they'll even be able to have something to talk about
> other than "RST QTH NAME WX AGE and BEEN HAM..YRS" before saying 73.

Ahh. One of the most amusing things about some Hams is that they are
such control freaks that they demand other Hams behave exactly the same
way. Some great unwashed said "Roger" on your repeater. Quick - send him
and the FCC a letter telling him to stay off of it. Don't like
ragchewing ? - "Get those kids off my lawn!"

Seriously, Give it a try. Operate CW wherever the mood suits you. Maybe
open up on the Maritime net frequency. They have no more right to that
frequency than you do. And since CW is a superior mode, shouldn't you
have precedence anyhow? What will eventually happen is that Once SSB Ops
find out it's a brave new world without any border, they'll move down
into your backyard, and any idea who will win that little range war?

I think it's great to have vintage enthusiasts to have a watering hole.
I wouldn't think that comments like :

> vintage enthusiasts might listen with
>> the hope of finding someone running something other than Kensues or
>> YaeCOMs.

Make it sound like you look at it as some sort of elite group, and
possibly not very friendly, except to those who are worthy.

Just sayin'

Doesn't your keyboard work? I have macros for a couple things, like CQ, and manually type most of my other stuff.

No one is making you use the macros.

And the comment is specious anyhow. If PSK31 is so bad because of these clicks you seemed to be forced into using, then why do CW Ops end out such shorthand instead of spelling out the entire word?

When I was first learning Morse, I kept thinking that I was not copying correctly. It wasn't until I asked around to more experienced ops that I found out the shorthand to CW operating. Modern day Morse comms were the original L33T!

My keyboard works just fine. There is absolutely nothing wrong with
shorthand, either via cw abreviations of PSK 31 canned responses. The
Q signals were the 1st form of canned messages.
What I observed with PSK31 was
 1. most PSK31 ops tended to fall into the "3 click" qso mode after a
few months of operating and

2. more PSK-31 ops than CW ops tended to go for the rst/qth... type
qso rather than rag chewing.
Numerous attempts to get PSK31 ops to go beyond the "3 click" qso
failed.
In addition, several ops became impatient with my insisting on typing
out my responses. (BTW I type well over 45wpm so it is not a speed
thing per say). This lead me to investigate the canned response type
qso to see what the attraction was.

Perhaps you might want to review a few of the late 60's QST and CQ
magazine editorials that brought up the same observations with regard
to RTTY. Only the names change, the observations remain the same.

I once built a push-pull class C amplifier using 833 tubes, with three continuously tuned inductors that could handle 80M through 20M. There was some definite power loss at 20M, but it wasn't to the point of having negative gain. Plate modulation using some kind of big lamp ballast transformer that I found.

I was also running the 833 well below the maximum rated B+, in part because I had a junkbox transformer and in part because I was using 833 tubes that were pulls from a local AM station which I was getting for free.

>that 60's article showing the 833A in a 80-40-20M amp is kinda clever

These days, gain is cheaper than it was back then, too. But it looks like an interesting design.

Sure, but can you get them free out of someone's trash? All the big planar grid tubes I found being thrown out are destroyed...

Kewl. Neutralization in push-pull is in my experience much more tractable because you just tap off the signal from each phase, feed it through the neutralization cap which is nominally identical to the plate-grid capacitance, and into the grid of the opposing tube. Mathematically the plate-grid capacitance is constant as you change bands so to zeroth order neutralization may not have to be adjusted for band changes. Did the same neutralization setting work across the bands?

I once tried to imagine a scheme where all 4 inductor taps in a push-pull front-panel-bandswitching scheme were switched with ceramic switch wafers actually inside each of the coils, and all the wafers are ganged with plastic cog belts. In the end I went with a much simpler plug-in coilset scheme.

> Sure, but can you get them free out of someone's trash? =A0All the big

It just occurred to me why ham amps with driven grids are so hard to neutralize compared to diathermy machines that donate their old tubes to the projects: You don't need to neutralize a diathermy machine at all!

No, it didn't. Part of that may have been the RF transformer on the
plates not being completely symmetric and that symmetry changing with
frequency.

The plug-in coilset is a good one, unless you suddenly find you want to
talk on a band you don't have a coil set for. I like the whole idea of
being able to continuously tune across all the bands and between all of
them. The problem with this is that you now have expensive big variable
caps or variable inductors, and they are usually sensitive as hell because
of the required tuning range... even a tiny tap and you're out of tune
again.

You know, I haven't heard anyone even mention a diathermy machine in
ages. These days the major ISM band polluters are plywood manufacturers
and WiFi users....

Hey gang,

It's time once again for the annual HCRA Auction. Join over 100 buyers
and sellers for a great time and good bargains.

The details:

HCRA Auction
Feeding Hills Congregational Church
21 North Westfield Street
Feeding Hills, MA 01030

November 6, 2009

Setup: 6:00 PM
Auction starts: 7:00 PM

Contact person: Jim, KK1W - kk1w@charter.net, 413-237-4666

Free admission for both buyers and sellers.

Seller fee: 10% (up to $250 per item) as club donation.

Raffle Prize: Yaesu VX-150R w/battery and charger. Tickets are $1 each or a book of 6 for $5 donation. Drawing at the end of the auction, winner need not be present.

New this year - HOT DOGS & soda! In addition to coffee & donuts HCRA will also be offering dogs and drinks!

Buyers: Free admission for everyone, members and non-members alike. Bring a friend and have a great time!

Sellers: Please mark your items with your name, call (if you have one) and minimum acceptable bid (if you want to). Items without a minimum will sell for the highest bid. Computer monitors and printers should be left at home, they typically don't sell for any reasonable price. There is no disposal on site, if it doesn't sell you bring it home! The auctioneers reserve the right to combine small items into larger groups to expedite the auction experience. 10% of the first $250/each sale is the selling fee.

Donations of items are always welcome. Do you have something so bad you would be embarrassed to put your call on it? Then donate it and we will get what we can with all of the proceeds going to help support this annual event.

More information on the club web site at http://www.hcra.org

See you there!

Jim, KK1W

I am looking for a working S-Meter for my NC-183...not a 183D. Please
check your junk boxes, spares, parts cabinets, etc. Mine has a bad
meter movement...cosmetics are great but the meter is not working.
Please e-mail with condition and price.

BR & TIA,

Terry

Hi, Gang

This Aussie site was mentioned on another radio forum,
but I don't recall ever seeing it mentioned here:

http://www.ling.mq.edu.au/~robinson/Manuals/

The site has plenty of World War II vintage manuals,
and a smattering of more recent commercial gear,
like the Mackay 3020A receiver (1971 vintage).

73,
Ed Knobloch

What does it look like?

Is it the same usual three-pin oval like HP test equipment used?

The HP cord is now the de-facto standard so that really makes it simple
to buy power cords. One size fits all.

Nope unfortunately it's a two pin.

Here are the links to the photo's of the unit and the plug I need the
power cable for:

Maybe that's all they got in the first place. Someone along the line wanted the cabinet for something, and took out the rig. Or someone wanted the rig to put into some other cabinet, which left the original available. Perhaps the rig was scrapped, but the case was still seen as potentially useful.

I have the cabinet from an RCA Carphone base. No front panel. I can no longer remember where I got it, maybe I thought I could use it for something or maybe it came in a box of assorted junk.

I don't for a moment think it's exceptional that someone would have the cabinet but not the rest. And I suspect there is someone out there who has the rig but not the cabinet (though whether the two get together is another matter).

And thank you so very much for re-posting his "trash" for those of us
who didn't see it the first time because we have functioning filters in
our news clients.

It was also very thoughtful of you to include the complete URL to his
web site.

Stuff like this should be reported to the originating ISP--- if it can be found. In this case the spam comes from Google Groups and has been reported to them. It appears that ninety percent of the spam in these groups comes from Google. They do seem to act although they make no reply.

To find the originating ISP click on properties then look at the entire source message. If you don't know how to read headers there are web sites that will tell you. Spam often has faked headers so this doesn't always work but, at least for Google Groups it does.

Replying to the group does no good, spamers rarely actually read the groups they post to.

They don't.  Not only that, but this is advertising a site on blogspot.com,
which is also run by Google.  You'll notice that abuse@blogspot.com does
not even work, in contravention of the RFCs.

These days, hardly anyone actually injects spam directly into Usenet any more,
since it's so much easier just to use Google.  Consequently, a lot of
backbone sites just drop all postings from Google, since they don't
seem to care about the problem and appear to have no intention of
doing anything about it.  Google Groups appears to be ignored by the
rest of Google now that it's not much of a moneymaker any more.  Google
bought the Usenet archives, made a lot of effort trying to complete them
and make them available, and then left the whole thing to rot once they
found there wasn't a lot of cash in it.

I have a Lafayette HE-80 receiver [similar to the HA-225] in
relatively good condition except for the dial face that could use a
some TLC. Removing it from the front panel looks a little tricky to
me. Has anyone been through this before and could give me some
guidance?

There's an "old radio" column in Popular Communication, and just earlier
this year it covered the HE-80.

Hey folks, only a week until the Auction. Are you ready? Here�s a brief update about what to expect on November 6th.

We have been very lucky this year and have acquired a lot of donated items (but we could use more � hint, hint). Up on the auction block this coming Friday will be a wide assortment of ham radio, computer and audio items that would look good in any shack. We have a Yaesu FT-747gx (tested and working FB), dual band HT�s, single band HT�s, a GPS unit, weather station, a Slingbox, audio amps, tape decks, tablet computers, a telescope, zip drives, PDA�s, wire, cables, antennas and more. I guess you could say we have everything from A (antennas) to Z (Zip drives). All items are owned by HCRA so all the proceeds will benefit our club.

This year we are instituting a minimum bid of $1 on every item. This is an effort to move the auction good more quickly and was a suggestion from one of our members. The auctioneers will also be mixing up the presentation a bit to keep things interesting throughout the entire evening. The hall opens at 6:00 PM for sellers and we plan on starting promptly at 7:00 PM. Also speeding up the process this year will be a computerized system to keep track of sales (thanks to W1SQ).

New this year will be J&J Hot Dogs! Jim, K1JAW and his assistant Jack, K1JAB will be steamin� and servin� until the dogs are gone. Thanks to both of them for volunteering to keep our stomachs full while we are emptying our pockets. It�s always easier to spend money on a full belly!

Tickets are selling fast for the VX0150R HT, this year�s raffle prize. We will have tickets available during the auction and will hold the raffle around 9:00 PM or so. A $1 donation could make you the big winner!

Buying, selling or something in-between there�s something for everyone at the HCRA Auction. Bring along a friend and have some fun this coming Friday!

�73�

I am looking for the schematic for the
RTL HT-144 2m transceiver.
Can anyone help?
I have searched the web without success.

I completed the installation of the SX-42 power transformer into the
SX-28. Mechanically it fits just fine - no problems.

The SX-42 transformer is 250 VAC either side of CT while the SX-28
transformer was 290 VAC either side of CT. This results in a 15%
reduction in plate voltage but the transformer runs at a normal 110
degrees F and the receiver seems to operate fine with no notable loss
in sensitivity etc.

Be sure to note the transformer terminal numbers per voltage etc.
befor attempting the replacement and write them on a schematic or
drawing.

Tom : W9IPR

Guys,

I designed test equipment and then more stuff to test the stuff we were building, so here is what I did for the test floor stations. The power had 2 settings, one for first power had 25 Watt Christmas tree bulbs in series and a bright light meant trouble, but at least saved the smoke routine. The second setting was straight power for the final test.
Simple?

Bill Baka

I'm the proud owner of a nice SP-600, unfortunately it is without tags, can someone help me to identify wich version I have?
Here below some details:
-Non-mil radio no yellow anti-fungus varnish at all;

-Disc capacitors, no black beauty;

-The antenna connector looks to have been factory modified to an SO-239 style to accept coax cable;

-Crystal deck with crystals

-Dial lock

-Gray front panel, white letters engraved.

thank you

Claudio

This is not enough information. There is a great deal of information on the web, do a Google search for sp 600 jx to find it.

There were more than twenty variations of the SP-600 made, most nearly alike. The total production was on the order of 25,000 units. Your description fits most of the receivers with exception of the VLF special, the JX-17 (has two extra switches and three small red knobs) and those made without the fixed frequency crystal unit. All have very similar circuitry.

The receivers should have a name plate on top of the tuning capacitor cover with serial number and version type on it. These are somtimes missing.

The disc capacitors were used in receivers built after the mid fifties but a great many earlier receivers built with Sprague Black Beauty caps were modified due to the very high early failure rate of these caps. Also many receivers were modified to have the SO-239 connector rather than the balanced coax connector originally used. All of the JX-17s had these from the factory.

I am pretty sure the anti-fungus treatment was applied after market and not all receivers have it. Actually this is an advantage if you have to work on the thing because the anti-fungus is very difficult to get off and often glues things together.

At least one of the web sites has a list of versions although its not quite complete.

FWIW;
I have an SP600 with the JX17 designation on the the tuner cover.
It has the balanced coax antenna connector, and coverage from 540 kHz
to 54 mHz, and no red knobs. Of course, there's always the chance
of a swap of tuner covers...
Nelson

The JX-17 was intended for diversity operation and has connectors for the IFO (second conversion oscillator) with a switch on the front and the BFO, also with a switch and aso a connector on the fixed frequency assembly to use an external HFO. This has an additional position on the crystal-VFO switch. It has some other minor changes to the circuitry: a different BFO circuit and fixed crystal circuit, and the BFO injection level is fixed so it does not have the injection pot on the back. These receivers were made with the coaxial antenna connector rather than the balanced connector used on other models, however many receivers were modified to use the coax connector. Its not a difficult mod but requires a lot of work.

Evidently, a lot of receivers were modified for diversity reception with unsatisfactory results so Hammarlund decided to offer a factory version. Most JXs, however have means for more simple diversity work, namely an IF output and access to the AVC and Detector lines.

If you want very high quality audio connect an external amplifier to the detector terminals (needs a DC blocking capacitor and is rather high impedance). The detector itself has quite low distortion. However, note that the normal AVC time constant is so fast that the level will vary with low frequency modulation. The cure is to run it in manual RF gain or to hang a rather large cap (a couple of microfarads) across the AVC terminal on the back. This is why the RF level meter bounces with modulation, it is measuring carrier level.

A last note: The SP-600 is a very good receiver but I think a lot of them are working but sick. The freqency calibration and RF tracking should be very good but I think the mechanical alignment of the tuning capacitor drifts with time so a lot of them are not longer properly aligned. The stators are held onto the frame with three clamp screws. The stators should be exactly parallel to the rotor and exactly centered. Also vertical alignment should be exact with the edges of the rotor and stator plates in line when the cap is closed. NEVER bend plates. Even though the end plates are slotted they were never meant to be adjustable that way. Once they are bent it is extremely difficult to ever get them straight again and the stress will eventually break the plates off the shaft.

Proper mechanical alignment requires removing the tuning cap. This is a lot of work but not really difficult.

I need some of the wisdom of the group. I started to have the
thunderstorm crash type of noise on all freq on my SX 100. I know this
is indicative of silver mica disease in the IF's when they have the
embedded mica caps built into the bottom base of the xfmr. Does this
also happen with discrete mica caps in the IF xfmrs like in this rcvr?
Any other ideas on possible causes? Thanks for the help. Mike KF6KXG

Start pulling tubes in the IF strip until you find the stage where the
noise is coming from.

Yes, the discrete mica caps can also exhibit similar breakdown. Once
you identify the stage, you can disconnect them and see if the problem
goes away.

Some resistor failures can seem similar, but they are usually combined with
microphonics as well. Not always, though.

Hi, Vacuumlanders (boat division :-))
I don't spend much of my time on boatanchors but this may be of
interest.
While restoring a Bendix RA 10DB receiver as part of a CASM, Toronto,
Lancaster bomber restoration project, see:
http://casmuseum.org/avro_683_lancaster_x.shtml
one of the decoupling caps failed spectacularly. It was C54. First
there was a smell as plate decoupling resistor R15 (1000 ohms)
overheated, then smoke (I think from from R15 paint), then C54 got
very hot and oozed a white bubbling substance... B+ had dropped from
221 VDC to 183 VDC... hit the off-switch fast! Fortunately, no
dynamotor damage. This unissued, NOS Bendix radio had earlier been
powered for about a hour or so in several check-out sessions without
any trouble.
The cap is one of several marked "Solar TYPE [blank] MADE IN USA .1
MFD 400 VOLTS DC GRD (at one end)" It has a rectangular brown
plastic case (bakelite?), about 1 3/8 x 5/8 x 5/16 inches in size.
There are several of these in the set, some but not all are under B+.
I'll be watching them. I presume this is a mica cap but others may
know better.
Just one small event in a myriad of restoration experiences, but
factual data... not just an anecdote!

Cheers,
Roger

The value is somewhat high for a mica cap but its possible and the shape is right. If it is mica its probably a stacked cap rather than silvered mica. I suspect that any modern plastic cap would replace it. GRD probably indicates the outside foil. Grounding that gives some shielding to the cap. It was common for tubular paper caps to indicate the outside foil by a line at one end and this may be the same sort of thing.

I don't know the mechanism of its shorting but that is evidently what happened.

IIRC many of these mica lookalikes are actually paper. On the smaller
postage stamp sizes the first color dot indicates type.

73, Roger

It's paper.

If you have ANY of these in any location where they can take out an IF
can when they fail, PLEASE replace them now.  The Xicon film caps are
cheap and seem reliable.

Thanks for all replies. Yes, it's paper! The dielectric is super
thin, brown, translucent (likely impregnated), skin-like paper with
very low tensile strength - I did not test for burst and tear but will
certainly be low!
I plan to replace all of these that are under any B+ stress before
further restoration. I'll be using modern 0.12 uF, 630 volt, black
plastic, rectangular caps (Korean made.)
Rare original IF's saved, Scott... and lessons learned!
Cheers,
Roger

Everything I buy from Korea is checked very carefully.
If I were you I would replace all those tubular paper capacitors with
the wax on them. I found some that the leads had come loose and you
could twirl the capacitor while the leads were still soldered into the
radio.

If you look at the capacitor inside the IF can, the primary and the secondary has very little insulation or separation between the primary to secondary capacitor plates. There is a great DC potential from the plate connected primary to the grid connected secondary. The potential is higher in your Hallicrafters than the usual AA5. That is where the silver migration or contamination occurs (from primary to secondary). Some times scraping the migrated silver or tarnish off will solve the problem. But I bet it would be only temporary.

I have fixed plenty of these "Thunder storm in a can" problems.

http://www.radiomuseum.org/forum/if_transformer_repair.html
http://www.ppinyot.com/if_transformers.htm

And as others have said, discrete component failure (non IF cans) can cause this symptom as well.

Good Luck,
Paul P.

Dear Friends,

I've a friend who own into his amplifier collection an HF Amplifier from
HARRIS model RF355 and he's trying to locate the information concerning the
commands to be sent over the serial RS232 line to drive the internal antenna
tuner automatically.
This kw HF amplifier was initially designed to follow an HARRIS RT1446
transceiver.
Could someone help in this search?
May be there are on this newsgroup some OM who worked in the past at HARRIS
communication division in the US or in the UK?

Many thanks in advance for the help.

Best 73's

Telford Electronics has manuals for the thing.

Harris, though, still supports it since it is still a current military
issue item.

They will also work with the RF-350K transceiver... a 350K or an RT1446 service
manual may have the details.

As I recall, there are two different ROM versions for two protocols. One is
a Harris-proprietary block protocol that has checksums at the end of each
block, and the other one is an ASCII protocol.

Peter Gottleib has some BASIC code to drive some of the Harris gear from
a laptop... years ago he was peter at newyorknerd.com.

Hi Scott,

Many thanks for this first investigation, we will contact Peter to see if...

Best regards and thanks again.

Like I said, it isn't rocket science. At home I use a Variac and a Fluke
77 on current range (20 Amps) to monitor it. I got lucky and have one
with a housing and voltmeter (5 Amp). On a new find I also use a light
bulb to protect my Variac. All you need to make is the light bulb
fixture and the above URL from Paul_P points to a picture of a good
example. With a Variac the switch can be eliminated.

If you read ARF, rar+p and the other Forums there's no end to complaints
about this guy.

I will say that they have never actually stolen my money.  But as far as
being lied to, not responding to inquiries, taking months to fulfill
orders and all of that they are King!  I don't think lousy service is
actionable.

I feel sort of sad for them.  The owner, Frank, seems like a pretty
decent guy and they do have a nice variety of stuff but they apparently
run the outfit off the kitchen table.  I think he is out of place trying
to run such a business in his fashion in today's environment.  Too bad :(

-Bill

It _is_ actionable to take someone's money then take more than 30 days to fulfill the order. If he's accepted the order but hasn't cashed the check then you'll have more problems.

Other businesses manage to run this sort of thing off the kitchen table and do OK, but you have to be cut out for it.

Has anyone had experience replacing the backup battery in the 747? I've checked the "On/Off" switch on the bottom, and it appears to be in the "On" position. I've cycled it as well.

Looking for a manual for an AN/UGM-11 (Wavetek 404) TTY test generator.
Have tried all the usual sources but no luck so far.
FYI, photos of an AN/UGM-11 are at http://jproc.ca/crypto/ugm11.html

I managed to get this $2 hamfest acquisition running last night. Fixed a power supply, traced out a bunch of the logic circuits, and replaced two dud chips. Hooked it up to my Model 28 and the Quick Brown Fox is now jumping merrily. (I'll clean up my circuit tracings some time and put them on a web page for anyone interested)

But besides QBF, this gadget also generates messages for a bunch of crypto machines - looks like garbage on the Model 28 but I don't have any idea what crypto test messages should look like - The AN/UGM-11 generates test sequences for KW-7, KW-37, KG-14, KG-84, and KW-46 equipments.

These are generated from much larger proms than the FOX prom so I guess that the messages are longer- but what the heck would they be? Any info or links to a crypto machine e-mail list would be greatly appreciated.

Huh, I wonder if the manuals are impossible to find because they were classified?

cheers,
Nick K4NYW

I have a clean photo copy (from Trucker) of the Panoramic Radio Products, Inc. manual for their Models SPA-3 and SPA-3/25 along with a big cable labeled "Singer Metrics 556161-096" which I think is the interface cable between sections. The manual has schematics, parts list, operating instructions and calibration sections. The schematics have 1958 dates on them.

I have no use for these. They weigh about 4 lbs.

Email me if you can use these.

Hello all,

I've been given an old Hammarlund SPR-210. It needs a good amount of restoration but appears complete inside and outside. I've seen on the manual that it has 600 ohm speaker output and I was wondering where to find such a spekear with this impedance. Probably there's need for an external audio transformer to use any low impedance (I have many in the 16-4 ohm range) speaker?
Any hint is welcome.
Best regards

Frank IZ8DWF

The usual fix is to use a 10-watt, 70-volt line to voice coil
transformer. The 10-watt tap on a 70-volt line to voice coil
transformer will provide a decent match to a 500/600 ohm output. In a
pinch, an ordinary filament transformer will do. Get a transformer
with a 120-volt primary and 12.6-volt secondary and connect the 120-
volt winding to the receiver and the 12.6-volt winding to the speaker
and you are done! --Ed

If you wound a 600 ohm voice coil on a speaker, it would be so heavy
you'd have no high end at all.

SO, what we do is to put a 600-8 ohm transformer behind the speaker; lots
of communications speakers have mounting points on the back so you can bolt
the transformer right there.

A 1W transformer for a 70V PA system has about a 600 ohm to 8 ohm ratio,
and will cost less than $5 at an electronics supply house. Or ask a guy
who installs 70V PA systems for piped-in music in supermarkets for an old
one.

thank you for the suggestion, I do have a spare 120V primary transformer
lying around (I live in a 240V country, so no use for it). I could also
wire my own transformer, but that would take some time.
I don't know what a line to voice coil transformer is, can you explain
better this part? Thanks a lot.
Best regards

     I've used filament transformers many times and they
work well. While the fidelity may not be as good as a
special purpose audio transformer I doubt you will be able
to tell the difference in this application.
     The Hammarlund Super-Pro is a very fine receiver and
will repay your work in restoring it.

Of course, one solution in the old days was to use a 400Hz transformer,
which were cheap and available as surplus, and which didn't have much
use in the average ham shack at the time. The idea being that since
it's intended for 400Hz, the upper frequencies might get through
the transformer better, and the loss of lower frequenices didn't matter
since for voice you didn't care about much below 300Hz.

Nowadays it may no longer be a solution, given WWII is so far in the past
and the stores that might have them for next to nothing nearby are gone
too.

400 Hz transformers are still very popular for modern aircraft applications.
There are still lots of them on the surplus market.

They catch fire if you connect them to a 60 Hz source because the series
inductance is very low.

They actually aren't very good as audio transformers even.

Really, they aren't good for anything. If you want some, let me know.
I even have a bunch of sealed 120VAC->200VDC supply modules, 400 Hz only.
Not useful.

There is one of these in my front step, used it for filler years ago. Saved a bundle in concrete. LOL About all they are good for these days, although I kinda miss the clackety clack of the old mechanical TTY's and the smell of hot oil and ozone.

I need to know what Yaesu gear these filters go in and the year.  I have
records back to 1985.  The FT-901 and FT-980 used a XF-8.9HSM SSB filter.
These filters go in the 8.9Mhz IF.  probably from a FT-101 series or maybe
the FT-1.

```

I'm restoring an SX-28A that has been extensively hacked, especially in the oscillator section.

The schematic shows a coil with one side attached to grids 2 & 3 and the plate of the 6SA7 oscillator tube, and the other side going through R47 (etc.) to the RF amp 6AB7.

I found R47 and associated components, but not the coil. Where is it supposed to be?

Oscillator coil #1 is shown on the schematic to be center-tapped like coils 2 thru 6, but my #1 coil does not have a center tap. The coil looks original -- is the schematic perhaps wrong? The #1 coil does nave a small 1-turn "secondary" wound over it: how should this be connected?

I'd appreciate any help to get this old Soldier operating again.

73,
Jeff
N6MNI

Hey gang,

It's time once again for the annual HCRA Auction. Join over 100 buyers and sellers for a great time and good bargains.

The details:

HCRA Auction
Feeding Hills Congregational Church
21 North Westfield Street
Feeding Hills, MA 01030

November 6, 2009

Setup: 6:00 PM
Auction starts: 7:00 PM

Contact person: Jim, KK1W - kk1w@charter.net, 413-237-4666

Free admission for both buyers and sellers.

Seller fee: 10% (up to $250 per item) as club donation.

Raffle Prize: Yaesu VX-150R w/battery and charger. Tickets are $1 each or a book of 6 for $5 donation. Drawing at the end of the auction, winner need not be present.

New this year - HOT DOGS & soda! In addition to coffee & donuts HCRA will also be offering dogs and drinks!

Buyers: Free admission for everyone, members and non-members alike. Bring a friend and have a great time!

Sellers: Please mark your items with your name, call (if you have one) and minimum acceptable bid (if you want to). Items without a minimum will sell for the highest bid. Computer monitors and printers should be left at home, they typically don't sell for any reasonable price. There is no disposal on site, if it doesn't sell you bring it home! The auctioneers reserve the right to combine small items into larger groups to expedite the auction experience. 10% of the first $250/each sale is the selling fee.

Donations of items are always welcome. Do you have something so bad you would be embarrassed to put your call on it? Then donate it and we will get what we can with all of the proceeds going to help support this annual event.

More information on the club web site at http://www.hcra.org

See you there!

Jim, KK1W

At the bottom of my page:

http://www.qsl.net/i0jx/geloso.html

you can download the dial scale of most Geloso VFOs (in GIF graphic format).

Printing the scale at 300 dot/inch, you get it at exactly the original size.

73

A while ago I bought a homebrew amp (80-10 meters) that uses
a single 833A tube. Its beautifully built. So far I have not been
able to find any plans or schematics for an amp that uses this
tube. Has anyone seen an article in QST, Ham Radio, or other
magazine of an amp using an 833A? No luck with a web search.
TIA
Steve W6SSP
p.s.-it has a tuned grid circuit

Probably not a "linear". Most likely a class C amp.

Paul, KD7HB

Check RCA transmitting tube handbooks of the 1950's to see if they have recommended operating conditions or even a sample circuit for using an 833 as a linear.

So far all commercial applications I've found are as modulators, not RF tubes. They are supposedly usable to 30 MHz but have yet to find a real world RF application other than the amp I have. I'll trace out the wiring and come up with a schematic. Once thats done I'll be able to figure out how its biased.

Steve

Lots of snipping...

833A's were widely used in AM broadcast transmitters both as finals and modulators of about 500W to 1KW rigs (RCA BT-1 etc.) and as drivers in higher power transmitters. I've seen designs for ham transmitters using them but I don't know if any commercially made _ham_ transmitters did.

On page:

http://www.criticalradio.com/833%20Rig%20Project/Web%20Pages/Text%20Article.htm

you find the diagrams of an AM transmitter using two 833s in parallel (class C), modulated by a push-pull pair of 833s.

Reducing the grid bias down to about -70V, you may operate the 833s in class B for linear operation, still grid-driven.

It may however not be easy to maintain the neutralization bridge nulled on the whole 3 - 30 MHz frequency range, and you may have to switch different capacitors in the bridge on the various bands.

Alternately, you may try a grounded-grid filament-driven configuration. You should then keep the filament at about +70V with respect to ground (using a 100W NPN power transistor with a 70V zener between collector and base). I however fear it may be hard to drive.

The Radio Amateur's Handbook (ARRL) 27th edition (1950) has several designs including a push-pull 813 amp but I haven't found a single 813 design yet. About that time perhaps...

As others said, most usefully class C, not linear. If it really does work well on 20, 15, 10M I'd be impressed. The 833A specs said it was good to something like 30 or 50MHz but really the interelement capacitances make it most perfectly suited for stuff under 1.5MHz, and 20M is probably really pushing it.

833A operating points for several different classes of service are in

"RCA Air Cooled Transmitting Tubes", TT-3. Online at http://www.pmillett.com/tubedata/TT3.pdf

With those numbers and the "generic triode amp" schematics from any ARRL handbook from 1940 till 1965 you are good to go.

Unlike modern screen grid or triode-in-grounded-grid amps, neutralization is a big deal. The handbook gives several different ways to do it but I know of none that would work from 80M to 10M. The older (pre-mid-50's) handbooks have more details and hands-on advice for triode neutralization than the later ones, when they pretty much assumed that everyone would just use screen grid tubes or, later after SSB came in, grounded grid.

Here's what I think came from some late 60's or 70's publication (some elements look like ARRL handbook drawings but others definitely aren't...):
http://www.mines.uidaho.edu/~glowbugs/tx/Universal%20Amp.pdf
They kinda sidestep the whole neutralization issue by swamping the 833A grid with a 50 ohm resistor, unlike yours that has a tuned grid, and I really doubt the linearity.

BTW, that TT-3 book is the best tube porn ever.

I'm out of room in the work shop so I thought I best try
selling a few items to help make some room.
The larger items are going to have to be pickup only I'm afraid.
When I get to the smaller things I'll be better able to ship them.

The first items are a desk top rack, and a vintage 2 (I think) meter
amp.

I've had the rack for probably 30 years, I bought it way back
when Surplus Electronics was still in business in Charlotte.
Here's a web page with some photos of it.
http://radioheaven.homestead.com/Desktoprack4sale.html
I'll take $35 for it, or best offer.

The vintage 2 meter amp, at least I was told it was 2 meter
when I bought it, would make an interesting project.
The chassis is dirty from having set for a long time. I did
a little cleaning on it this afternoon and with a little work
it would look OK. I have no idea what I would take to make
it work, it's missing both tubes and I don't know what they are.
I'd like to get $25 which is what I paid for it.
Here's a web page with photos of the amp.
http://radioheaven.homestead.com/Vintage2meteramp.html

Like I said, these are pick up only, no shipping.
I live near Charlotte NC and will happily give directions to
anyone wanting to come check them out.

I may be able to deliver them to the Fall Swap in Greensboro
if they're paid for in advance.

There are more items to come, this is just the tip of the Ice burg...

BTW, that TT-3 book is the best tube porn ever.

Tim N3QE

There is a lot of very good stuff on Pete's web site.

I have an actual TT-3 in front of me. On page 91 there is a chart showing the effect of frequency on output power and efficiency and also allowable plate voltage up to about 150 mhz. Its obvious the tube falls off rapidly beyond its full rating frequency of 30 mhz but most of the other tubes available at the time would do no better although plate-to-filament capacitance of the contemporary Eimac triodes was a lot lower. Their maximum rating frequency limit was 40 mhz.

I've got one too. Best tube pr0n ever!

> On page 91 there is a chart showing the effect of frequency on output power and efficiency and also allowable plate voltage up to about 150 mhz. Its obvious the tube falls off rapidly beyond its full rating frequency of 30 mhz but most of the other tubes available at the time would do no better although plate-to-filament capacitance of the contemporary Eimac triodes was a lot lower. Their maximum rating frequency limit was 40 mhz.

I'm not exactly saying that RCA lied in their graphs, but somehow what is published there is not particularly useful for ham amp use.

I know that 833A's work in diathermy machines, and I think that those were circa 27MHz at least in the 30's and 40's. So obviously in the right kind of circuit I think they are useful (if maybe not top efficiency) at those frequencies.

But my experiments with them in ham amps showed that I was unable to get any usable output above 20M with a single tube. Meaning, I was putting more power into the tube than was coming out. I think in push pull some of the strays could cancel but bandswitching all the inductor sections (as opposed to plug-in coilsets) for push pull is onerous.

I will not really believe a 80M-10M grid-driven 833A actually working usefully on the upper bands. I'm sure the OP has a very nicely constructed box. I just won't believe that it's useful on 15M or 10M until I see it working there. And even on the lower bands the problem of neutralizing the circuit across band changes looks hairy. With plug-in coilsets that changed the neutralization out with each band change, I can see it. Bandswitching all that seems completely ungainly.

All just IMHO. I fully share everyone's fascination with grid-driven big triodes and love playing with my 833A's and their link-coupled output and neutralization networks in that spirit. But grid-driven triodes just do not fit into the "twist the knob on the front panel to change bands all the way from 80M to 10M" picture that modern hams have of a linear amp: neutralization across just a single band can get hairy, never mind across several octaves of RF.

That 60's article showing the 833A in a 80-40-20M amp is kinda clever in sidestepping the neutralization issue by just swamping the grid with a honking huge 50 ohm noninductive power resistor, but my estimation is that more than half the drive power gets turned into heat and never hits the grid. And note that they don't claim it'll work well above 20M

There's good reasons why from the 50's onward, the beam power tubes and grounded grid triodes have ruled: neutralization is a zillion times easier, bandswitching from 80M to 10M is not so hard, linearity is useful for SSB, etc.

Thanks, Bill.  I've used these rectagular black plastic 0.12 (and
0.18) caps for a while now as coupling caps in various amplifiers and
radios with no problems - virtually zero mV positive voltages measured
on any g1's.  I have a bag of each, acquired from a retired EE and
radio hobbyist.  Also used them for RF decoupling in radios, again no
problems.
Cheers,
Roger

Roger,
I have an old Echophone on my computer desk right now and the bottom is missing as well as the back. It has normal round resistors, octal tubes, and 5 wax covered paper caps. There are other caps that look near the same but no wax on them. Could be the wax oozes out after 60 years or so. There is a foil .25uF @ 200V and 2 electrolytics at 80 uF @ 150VDC and a 30uF @ 150VDC.
I have a Heathkit cap checker and a Fluke 77 for checking the resistors so next comes the fire up and check for noise. It isn't, as I always say, rocket science, but a fair amount of work.

Of course a schematic would have been nice but I think I can trace it
out with not too much problem. There is a cap dangling but I think I
know where it goes.
My new, small project.
Thanks for listening.
Bill Baka

Two comments...
Bill, good luck with the radio project.  I have an old cap checker
with eye tube (in virtually new condition) but find it of little use,
rather it's just a curiosity.  A DVM (use your Fluke 77) and a
variable B+ voltage source is much more useful. A Q&D check on
coupling caps is to measure the voltage on the following g1 - anything
over +2 mV to ground is suspect.  But don't bother to check the wax
caps, just replace them all - electrolytics, too.

An earlier post suggested I replace the risky brown 0.1 uF caps in the
Bendix RA 10DB receiver if their failure could take out an original
IFT. As far as I can see, no shorted decoupling cap can take out any
IFT since they are all above the IFT's.  But, if they fail, they will
take out the 1Kohm decoupling resistor and stress the dynamotor so, as
I said, all the ones with B+ on them will be replaced.
Cheers,
Roger

I am pretty sure that there are some Echophone schematics on BAMA or Nostalgia Air. Echophone was bought by Hallicrafters at some point but they continued to make Echophone products for a time. The famous Hallicrafters S-38 series appears to be based on the Echophone.

Discontinued, heavier than an S-38, broken down.

I think it meets the criteria.

I friend of mine has to rewind the transformer of his Hallicrafters HT-32A, but he does not know the precise AC voltages (apart from filaments of course).

AC voltages could be determined knowing the DC output voltages, but it would be safer to take measured data.

I wonder whether anyone has, by any chance, noted down the AC voltages?

Thanks and 73

Thanks for the tip, but in our case the transformer had already been re-wound once. Unfortunately voltages are incorrect, so it must be re-wound for the second time. And it is therefore not possible to determine the number of turns for the various windings.

How incorrect ARE the voltages?

If the plate voltage is 20% high for instance, measuring the DC level, that means the AC voltage on that winding is 20% high too. And so you need to remove 20% of the windings. So you do have a reference after all.

In the solid state world you can just assume the DC voltage after the rectifier is 1.414 times the AC voltage, minus the diode drop. Problem is that in the tube world there is often a substantial resistive loss through the vacuum diode.

But, you can measure that! Measure the DC drop across the diode, then work from the desired DC voltage, plus the drop, times 1.414 to get the AC you need. (This is assuming the diode drop will change only a little bit once you get the voltage perfect. If it's not, use the nomograph in the RCA HB-3 handbook to work it out).

I'm wondering if there's anyone here, local(ish) to me, who'd be interested in an Avo Valve Characteristic Meter. My Dad recently passed away and I've inherited it, along with a beautiful CR100 ex-Navy comms receiver.

I'll be keeping the radio as I've so many memories from childhood of slowly (oh, so, so slowly!) trawling my way through the bands; [1] and it does still rank as a pretty good receiver.

The tester on the other hand isn't really of much use to me. I'm competent, after a fashion, with valve electronics but I've so little clue on how to use it and almost no spare time.. My Dad, however, saw it as indispensable kit for his restoration work.

I've checked up on eBay and it seems I could get a very reasonable price if I were willing to go through the bother of figuring out shipping and all that kerfuffle, but I'd much rather avoid the trouble. I'm willing to accept slightly below what it's worth, or rather roughly what it's worth, but with free shipping (ie delivery, by myself, in a car!). The sticking point is finding someone within 70 or 80 miles who'd be interested.

I'm based in Sheffield but regularly travel to N.Wales, so anywhere close to the relevant motorways counts as accessible. Likewise pretty much anywhere in Yorkshire.

[1] And of matching it to a homebrew interface card, bolted onto my prized ZX81, running a homebrew RTTY/Morse translator! What a lovely mixture of museum exhibits that would be, what a span of years; if I could only find the relevant bits and have a go at resurrection :-)

Thanks for any input, sorry for the distracted ramblings ;�)

Oh, and it's a Mark IV Avo.

--
Dave Johnson.

If it's what we call a 'tube tester' over on this side of the pond, i.e.
a serviceman's that you stick a tube into and it tells you if the tube is
good, you may want to keep it around as a tool to keep the receiver alive.

If it's something fancy that you'd find in an engineering lab or similar,
then you want to trade it for the serviceman's tool.

Just out of interest, how long has diversity encoding been around? I thought of it as relatively modern, and I've only read about it from the POV of digital signals. Is there anywhere anyone'd recommend for a bit of research? Something semi chronological would be nice.

It goes back to the thirties, at least. Hallicrafters had a diversity
receiver back then, I have no idea how many were sold.

There was an article in "Ham Radio" decades ago about diversity and
specifically about that Hallicrafters radio. Looking at an accumulated
index, I think it was the April 1980 issue. But, there was a history of
Hallicrafters in the same issue, and that one (from the same accumulated
index) is supposed to be in the Nov 1979 issue, which makes more sense
since for a long time the magazine devoted the November issue to
receivers.

Back to the thirties at least.  Earlier diversity systems were comparatively
crude, though, normally just looking at two antenna systems separated in
space or in polarization and picking the one with the higher AGC voltage.
This can give a remarkable improvement in dealing with ionospheric fading,
though.  Was standard practice for remote shortwave links on broadcast
networks.

> How incorrect ARE the voltages?
>
> If the plate voltage is 20% high for instance, measuring the DC level, that means the AC voltage on that winding is 20% high too. And so you need to remove 20% of the windings. So you do have a reference after all.
>
> In the solid state world you can just assume the DC voltage after the rectifier is 1.414 times the AC voltage, minus the diode drop. Problem is that in the tube world there is often a substantial resistive loss through the vacuum diode.
>
> But, you can measure that! Measure the DC drop across the diode, then work from the desired DC voltage, plus the drop, times 1.414 to get the AC you need. (This is assuming the diode drop will change only a little bit once you get the voltage perfect. If it's not, use the nomograph in the RCA HB-3 handbook to work it out).
> --scott

Hello Scott,

yes, the difference between the voltages measured on the (ill) re-wound transformer and the original AC voltages (that I now precisely know) can be useful to determine how many turns more or less are required for each winding.

That can be a useful information, as a potential problem is the fact that the original transformer was designed for 60 Hz, and the turns, once calculated for 50 Hz operation on the same iron, may not fit the available space.

Anyway I should get that transformer within a few days, and I will then discuss with the rewinder how to best proceed.

     Space diversity is indeed that old but there were some
fairly sophisticated methods such as the Bell Labs MUSA
Multiple Unit Steerable Antenna which could be varied in
vertical angle electrically. RCA was using triple space
diversity receiving systems at the Riverhead N.Y. receiving
station in the 1930s. I suspect one could find a lot of
literature in the old Jornal of the IRE and probably also
the Bell Labs Technical Journal and RCA Review although I
don't have specific citations.
     Around the 1950s Leonard Kahn and others worked out
means of combining the sidbands of a conventional AM or
double sideband suppressed carrier signal using a
synchronous detector. In effect this was a sort of frequency
diversity. It also reduced distortion due to selective
fading since it regenerated the carrier locally.

Wasn't it Webb at GE that was doing the work on DSB? That's the name on
the synchronous detector article in "CQ" in the late fifties, and that was
either preceeded or followed by an article about DSBsc in general.

And John Costas of course came up with the Costas Loop for receiving AM,
and I see he was at GE in the fifties when he came up with the Loop.

Diversity is certainly not a new concept. It was present in the RCA AR88
designed about 1938-9!

I've seen pictures of AR-88s in triple diversity set-ups. I don't know if that was ever used at the big RCA Communications stations but at least one of the on-line service manuals for the AR or CR 88 has a catalogue sheet and photo of one in the back.

You may be right. GE did a lot of early work on SSB and
DSB. GE had a very fine research department until John
Welsch killed it.

Thanks for the site for the manual dowload. I consider the FT-990 to
be a boat anchor because it is almost 20 years old and has a handle to
tie the anchor rope to to keep the boat from drifting.  But, the
FT-990 is avery good computer in a radio box back before IC's, many
diodes and single stage transisters.
Found the 3V battery on the control board. But Yaesu used a spot
welded clamp to hold the battery, HARD to remove.

I think it's a pretty fancy tool. Afaict it measures pretty much
everything of a valve's performance and allows you to set each voltage
appropriately for the various measurements.

The description given by one site is

"The AVO Mark 4 Valve Characteristic Meter comprises 19 valve holders.
input selector switch and variable operating parameters for testing

valves. Provision is made for by means of plug-in adaptors to cater for
newly introduced valve bases."

If you (or anyone else for that matter) are sufficiently curious, there
are some beautifully clear pics, from several angles, large and clear
enough to read the function of each control

at

http://digilander.libero.it/pasqua49/COLLEZIONE%20HI-FI/AVO%20MKIV/
AVO%20MKIV%20Valve%20characteristic%20meter.htm

or, to avoid word-wrap hassle, at http://tinyurl.com/AvoMkIV

Thanks for the reply anyhow, I suppose it's ebay or nothing. I'm not aware
of any antique-radio magazines in the UK or I'd consider advertising it
there. It's worth enough to make for a fractionally improved Christmas :-)

This looks like a conventional transconductance tester.  It's what you
would expect your local TV repair shop to have for testing tubes.  It's
not a fancy design tool like a curve tracer, and _because_ it's a fairly
common service tool, you shouldn't have any problem selling it.

>Thanks for the reply anyhow, I suppose it's ebay or nothing. I'm not aware
>of any antique-radio magazines in the UK or I'd consider advertising it

Ask your local ham radio club.  Someone there is apt to want one.  Also
try guitar shops.

If only :-) It's a lovely bit of equipment and I primarily want to be sure
it'll go somewhere it'll be as well loved as it was by my Dad. The
involvement of money is, however, a significant side benefit ;)

Heh, I suspect there may be an inappropriate tense in there <grin>.

Ok. From my amateurish POV it *looks* quite fancy :-)

If it measures characteristics of which I have only the faintest working
knowledge then by my standards it's complex enough.

If the 'curve tracers' you mention are the sort of tool I imagine from the
name then in those (pre d <-> a / computer) days they must have been
beautiful designs.

Hadn't thought of a guitar shop, though I'm surprised your average guitar
amp's all that fussy WRT valve specification? I'd have imagined more the
sort of pass/fail testing I'd cobble together as a psu/pot/avo birds-nest
on my workbench.

Any extra idea's worth a try though, thanks muchly.

Dave

The British Vintage Wireless Society (BVWS) has a regular magazine. I'm sure
their members would be interested.

I've just acquired a couple of Clansman 5.4m masts and, while erecting them doesn't really need instructions, they are so pristine it would be nice to have them "as issued", which I suspect includes a set of "field instructions". (I've some older 27' metal masts with such instructions on a metal plate.)

Does anyone know if similar field instructions are issued with the Clansman masts? If so, a scan or description would be nice so I know what to look for under the table at rallies.

Nice to see you on here, Brian. I have often wondered why you bother with that infamous negative and nasty newsgroup allegedly about amateur radio in the UK.

What makes it complex is the fact that tubes all have different pinouts. There are three or four controls on there that set voltages and loading for the tube, and the rest of the controls just are for selecting the pinout.

>If the 'curve tracers' you mention are the sort of tool I imagine from the

>beautiful designs.

The curve tracer is basically a device like what you have, except that it makes one parameter adjustable and displays a plot on a CRT of the plate current with respect to that parameter. Some of them make two parameters adjustable and display a family of curves.

Anything you can do with a curve tracer you can also do by hand with a transconductance tester like you have, and a sheet of graph paper, and a lot of labour making individual measurements and plotting the curve.
The transconductance tester is normally used for simple go/no go tests, and for matching tubes based on their plate current at a single point in the curve.

The guitar shops usually aren't too worried about that, but everyone would
rather have nice test equipment than poor test equipment.

I have a very nice HQ-120X Hammarlund receiver that I am restoring that needs a BFO coil. The one I have is open and the break is not visible. Does anyone have a parts radio with a good coil? I will take the whole can unit which consists of the BFO coil and trimmer and the AVC switch, or I could use just the coil.

Thanks for your help & 73's,
Larry W4LK

I need tjhe wisdom of the list as this one has me totally stumped. A week ago I posted about static crashes on this rcvr. The collective advice was to check out the stages by removing tubes and then replace the micas (which are discrete components on this rcvr) in the IF cans. Well, the first tube that made a difference by removal was the 50.75 KC IF amp (6C4 V13) on the 2nd converter IF chassis so...I bit the

bullet and pulled the subchassis. Easier said than done on this rcvr.
I replaced the micas associated with T3, T4, and T9 the cans on the
subchassis. Still had static crashes...so I replaced all the IF micas
in the other cans while I was at it. Aligned it and sensitivity is
great but still static crashes. I thought maybe the C31 mica which
carries the signal out of the subchassis to V13. Tried subbing a cap
in and same result. The funny thing is that when I put my signal
tracer on V4 or T2 which is the 1st IF amp, I can hear the crashes,
but removing the V4 tube doesn't have an effect. Also removing the
tubes V5 and V12 on the subchassis doesn't stop the crashes. Several
questions. Could the static crashes be back feeding from the
subchassis to T2 or is the problem in that stage? Besides micas what
other component failures should I be looking for? Can a bad tubes
cause it? Thanks in advance for help. Mike KF6KXG

I have had "static crashes" due to dry electrolytics. If you have a scope,
you might watching the dc lines to see if you can observe any of the
"crashes" there. I would also replace all of the paper caps.

It could be a number of things, such as a poor ground caused by oxidation or
even a noisy resistor. A scope should be able to help you isolate the
general area.

Note that if it is a bad electrolytic, often paralleling a good one will not eliminate the crashes. The bad one needs to be removed from the circuit.

Hang in there. We all go through this at one point. I remember my friend had a microphonic mica cap iinside an if transformer of his NC-183D. He worked on it every night for 6 months until he found it.

73, Colin K7FM

Colin,
Thank you for your recommendations. I replaced all the
electrolytics 5 years ago when I got the rcvr. When I pull the 2nd IF
tube they go away. So I don't think the electrolytics are the cause. I
have tapped all the resistors and remaining micas (except the
subchassis because it was removed) and nothing is microphonic. Does a
resistor or mica have to be microphonic to cause the crashes? Mike

Okay, thanks Richard. I was a bit confused by all the merges and
take-overs... Nice to see the company has some really old roots.

I'm restoring a 420 tube AN/FRR-24 triple diversity HF receiver - all
3121 lbs of it.
I need a few more rack-mount modules -
     CV-127/FRR-24 FSK converter with scope
     PP-648/FRR-24 & PP-649/FRR-24 power supplies
          (any FRR-24 or FRR-37 power supplies will be very helpful)

Also looking for rack-mount modules for AN/FGC-5 and AN/FCC-3
telegraph (TTY) multiplex systems.

It's important to note that when Marconi first tried to market his invention he was laughed out of the country (Italy). Marconi's first backers were British. Therefore it was a long time before you would find a Marconi "wireless" on an Italian ship, the company would not sell to them.

As a little history, Marconi used the letter "M" for callsigns, so that's why Great Britan has both the "G" and "M" prefixes, although it has only been very recently that they started using M for ham calls.

The Titanic's call sign was MGY. Before sailing it may of had a different callsign, I was told that once, but have recolection of who said it or where (sorry). Or for that matter, what they actually said.

Like all telegraphy companies at the time, Marconi used codes to reduce the amount of sending in each message, they began with the letters "CQ".

That's where "CQ" came from as a calling signal, it meant calling all Macroni stations, or with a callsign calling Marconi station Mxx. There were others starting at CQA, but the most famous one is the fourth, which was supposedly assigned that way because it was the fourth one they made up, not for any other reason, "CQD", "calling Marconi stations, I need assistance", or in plain English "HELP!!!".

The Marconi radio operator in New York City who received the Titanic's distress call was a young boy named Sarnoff who later founded RCA.

Geoff.

While Sarnoff was involved with the reception of Titanic distress signals he was not the sole operator and later much exagerated his role. He was very good at self promotion. See the biographical artical at Wikipedia which appears to me to be pretty accurate.

Thanks for your responses! This SX-28 is far from stock and is
extremely over-sensitive. I bought it about a year ago to help me
compare wiring and performance to my 1st SX-28, but this one was so
modded up, it was no help. The radio works ok, though, but requires a
lot
of knob tweaking to make a signal sound good. I have to run the RF
gain at
4 or below. I used to think that was a good thing
until noticing all the cross-mod on 40 and 49 meters.
There is a 6SG7 where the 6AB7 1st RF ought to be.
This receiver also has a 6H6 installed where T5 used to be.(far rear

right)
There is a 2nd 6H6 installed next to T6 (where the stock 6AB7 used to
be)
So thats 2 6H6s! There is an additional switch on the faceplate for
the noise limiter,
and the original noise limiter pot was replaced with a switchless
type.
There is also a 6SN7 where the stock 6H6 used to be.
The 6B8 that was with T1(1st IF) has been replaced with a 6SG7.
(The 6B8 pentode wire in T1 has been removed.)
The S meter was replaced with one labeled "carrier" and has very fast
ballistics.
It does OK on SSB, but the BFO sometimes has a little warble.
Its been re-capped, but not the RF deck. The dial calibration is dead-on.
If you have any thoughts as to what these mods were trying to
accomplish,
I'm all ears. In the meantime, I'm going to replace the hotter tubes
with the stock originals,
one by one, and see how that affects performance. I really wasn't
intending to do a
complete restore on this SX-28, having done one already, and have had
that thrill.
Thanks for your help!

There should not be either a 6SG7 or 6AB7 in the receiver. Both RF stages are 6SK7s and that may be part of the problem.

When the SX-28 was designed it was equipped with a Lamb noise blanker. This was a complex circuit intended to blank out the IF when a noise pulse came along. Such blankers are fairly common now but its characteristics were not very well understood at the time so the SX-28 blanker did not work well. Hallicrafters later offered a modification which removed the Lamb circuit and replaced it with a stadard noise clipper. That may account for the extra tube.

Also check to see what was done to the AVC. If its been modified it may be worth unmodifying it. Note that the use of high gain tubes may upset the AVC permitting the lower gain tubes to be overloaded because the high gain tubes will shut down with much lower AVC voltage than the other tubes need to be linear.

The SX-28 does not have very good image rejection and tends to have a lot of spurious responsed due, probably, to lack of adequate shielding. Image rejection depends on the bandwidth of the RF stages. Some receivers simply have better RF than others. For instance, the Hammarlund Super-Pro, which also has two RF stages and a 455Khz IF has significantly better rejection than the SX-28 and is pretty much free of spurs. It also cost nearly twice as much when new.

I think the noise blanker mod for the SX-28 is included in the BAMA stuff, I was able to download it somewhere.

There are also differences between the SX-28 and SX-28A, again, both manuals are available at BAMA and are worth looking over.

I rather think that Hallicrafters suffered from wishful thinking in some of their designs. Their aim was usually to make economically priced receivers of good performance but they were seldom, if ever, top of the class.

That part of history was also covered in Tom Lewis's "Empire
of the Air" that was made into a PBS documentary. It's a good
history of the early days of radio, focusing on Sarnoff, Armstrong
and I guess deForest. Since it's not dealing with a single
subject it's less likely to dote on the subject. It's been about
a decade since I read the book, but my recollection is that it
made that point about Sarnoff inflating his role in the Titanic
affair.

This is the first I've seen that "CQ" is because of the Marconi
company, and I suspect a deeper search into history would reveal
some other explanation.

There are three RCA jacks in the back for the input.. They are labeled
H C V

>> I'm going to take a very wild guess and say Heterodyne Oscillator,
>> Carrier Oscillator and VFO.

>> As to how to access those points in the radio I haven't a clue.

>> -Bill

What I found out:

Power + goes to the right of the unverted U with the inverted U on the bottom. - to the Left.
seems to start working at 9VDC. There is a 5VDC Regulator in side the box and a 25VDC 470pf Filter cap (before the regulator). I think it is a dual supply system.   Some may take 12VDC and other take 5VDC. I didn't crank it to 12 Volts since I wasn't sure and didn't want to burn out the unit.

C input took a 1 -> 3 volt square or sine wave and displayed from > 0 to 31 MHZ. It started dropping off after that. I didn't put the sine wave aplitude any higher that 3 Volts, though TTL would suggest a voltage of 2 to 5 Volt logic 1. it seem to pick up the signal even when it dropped lower, but I didn't get diffinitive measurements of when it completely dropped and no longer triggered the frequency counter / display unit.

Now, What would be the use of the H and V connections if they are indeed Heterodyne Oscillator or VFO...

Would ALL THREE need to be hooked up? Or was it built for several different rigs where you only had to connect up one of the RCA jacks. I am thinking this is not the case since mine has three RCA jacks hooked up to it and they seemed to have been with the unit since i got in a box of stuff from an estate sale.

Thanks in advance for all your help!!!

Hope to hear more ideas!!

ALSO 'someone' (lol) told me that the Grand was a rip off of another design that was built for the TS-520 and the TS-820.. Anyone know of any displays that were built for these radios back then?

I am not sure what radio that it actually hooks up to. I will have to hope some of the old timers out there remember this Jewel and can come up with some answers. I am also wondering if It could me modified to fit other radios since it just seems to need 2-3v sine wave to make the Freq Counter / Digital display to work...

Thanks again!!

S.

Thanks for your comments. I pulled the 6AG7 and replaced with a 6AB7
(which Halli changed from the 6SK7 after the 1st year, its engraved on
the
socket). And that extra 6H6
should not be there, I pulled it and replaced it with a 6AB7 (per the
socket engraving)
and the cross mod went away. The rest of the mods seem to be in line
with
the noise limiter mod that Halli did a service bulletin on at the time
and offered to rework the
radios because the mod was extensive. Half of the 6SN7 was to be a
calibration marker, but
that mod wasn't performed on this radio. Its an H-132836 (1941).
Still wonder about the 6B8 being replaced with a 6SG7. But the radio
works really well!
Pete

Well, as I indicated I was only guessing. And I still am.

For the unit to measure the actual frequency it needs to combine the H C
and V. Thats not necessarily found at any particular point in a
receiver. The actual frequency of the receive signal disappears beyond
the RF amp stage in a superhet radio. (A transmitter is different since
these are combined in order to transmit.)

The lashup is probably universal to many rigs. Not in the sense that
you use one single input versus another but that different radios would
have different frequencies for the heterodyne Osc, VFO, etc. You have
to combine them all to get the correct readout.

Labelling things as a rip-off is somewhat subjective. There's 'x'
number of ways to measure a frequency and if one circuit resembles

another then any similarities shouldn't be a surprise. Jeez, how many
different models of AA5 radios are there out there all using the same
basic topology?

As I suggested in the previous post I gather that the unit was a
one-size-fits-all type of display that could work with many different
radios. That would be the rationale for the three inputs.

Thanks for your comments. I pulled the 6AG7 and replaced
with a 6AB7
(which Halli changed from the 6SK7 after the 1st year, its
engraved on
the
socket). And that extra 6H6
should not be there, I pulled it and replaced it with a 6AB7
(per the
socket engraving)
and the cross mod went away. The rest of the mods seem to be
in line
with
the noise limiter mod that Halli did a service bulletin on
at the time
and offered to rework the
radios because the mod was extensive. Half of the 6SN7 was
to be a
calibration marker, but
that mod wasn't performed on this radio. Its an H-132836
(1941).
Still wonder about the 6B8 being replaced with a 6SG7. But
the radio
works really well!
Pete

The handbook I was looking at seems to have been the
first so it didn't show the tube change. Undoubtedly H made
the change to improve the performance on the top bands where
the 6SK7 is too noisy and has gain problems.
Its amazing that anyone would substitute a 6H6 for a
6AB7 but maybe they just stuck any old tube in for some
reason.
Anyway, I'm glad the thing is working well. They sure
are sexy receivers.

>
> -Bill

Well, Just a follow up.. I dropped the 820 Idea and ran with the 520S and looked at a online manual for the radio, It seems that kenwood made a DG-5 that connected directly to three RCA jacks and a power jack in the back of the radio.

Looking at the DG-5 Manual, it explains,

The TS-520S operating frequency is made up as:

oprfreq = HET-(VFO+CAR)

In the The DG-5 where two counter circuits are connected in series, the heterodyne signal is fed to the lower counter. This lower counter subtracts 10MHZ from the heterodyne frequency in a digital way (HET-10MHz). The subtracted frequency presets the upper counter. The other signal fed to the upper counter is composed in the manner that the carrier frequency is mixed with the 10MHZ reference frequency and the resultant is further mixed with the VFO frequency. [(10MHz-CAR) - VFO]. The signal is added to the one preset by the lower counter, that is:

[(10MHz-CAR) - VFO] + (HET - 10 MHz) = HET - (VFO + CAR)

As explained above you will find that the GD-5 should display the correct TS-520S Operating frequency. The reason of using such a complicated construction is that if the DG-5 is the same as the TS-520S in the construction, this can produce a signal of the same frequency as the receive frequency. The signal interferes as spurious with the operation of the TS-520S.

So just giving the (H) Jack an input would yield (operating freq = (Het - [VFO (0) + CAR (also 0)]

The power plug also is keyed identically, and plugs directly into the radio. The manual explains that you can use this connection (13.8VDC .9A) or use an independent power supply.

I guess the only question I have left, Is.. How did KK7US get the GD-6K to work with a TS-820???

Looking at the manual, I saw a connector for an external VFO... but I
don't think that is where it was hooked up to.

Idea's anyone???

Thanks!!!

S.

> It is a 3/64" hex wrench on my HRO-50,
> I assume unchanged on your HRO-60.
>
> 73,
> Ed Knobloch

Hi Ed,

just a curiosity.

In Europe the hex wrench and spanner size varies in increments of 0.5 mm (a little more than 1/64"). We then have wrenches of 0.5, 1.0, 1.5, 2.0, ... Very easy.

In the US, instead of always expressing size as multiples of 1/64" (that is 1/64", 2/64", 3/64", 4/64", 5/64" ...), when possible you simplify the fraction (that is 2/64" --> 1/32", or 16/64" --> 1/4"). I wonder whether the average AmerIcan, not necessarily well accustomed to play with fractions, can instantly determine that, if e.g. a 17/32" spanner is too big, he should try a 33/64" spanner before taking a 1/2" spanner.

Marconi came back to the USA after WW II as GEC-Marconi. For awhile (until, ablout 1996) the Company was GEC-Marconi Avionics (Norcross, GA)and later just Marconi Avionics. They moved to the Dallas area and I have no idea if they exist any longer.

Canadian Marconi existed for years with the Canadian Government and Military as their giggest customer. They licensed the RCA AR-88 receiver and some of the RCA/Marconi gear until well after WWII.

GEC (UK GE) still runs Marconi in the UK and Marconi Avionics was a unit.

You might consult books such as Shortwave Receivers: Past and Present by Fred Osterman for more company info.

Bill,

If you can't find the grey version I have found excellent results in similar situations with simply spray painting a black one with a can of high sheen (high gloss) paint in the desired color. Take an original grey knob to the hardware store, though, because there are many shades of "grey."

I could live with that. Do you have an extra black one?

Tnx

Hi, Tony

I don't know about other guys, but rarely do I consider
the numerical size of a hex wrench, just try the next larger or smaller
one in an index. The smaller ones aren't even labeled.

What makes my head hurt was the British coinage before decimalization:
12 pence in a shilling, 20 shillings in a pound.
With coins like florins (2 shillings), crown (5 shillings),
half-crown (2 shillings and 6 pence), farthing (1/4 pence),
etc. Then there was the Guinea of 21 shillings:
a professional would bill you in Guineas
for his services.

I guess the only residue of that system is that kids
here in the States still memorize math tables
up thru 12 x 12. That may be a holdover from the 12 pence per shilling
days.

73,
Ed Knobloch

Unfortunately I keep all my inch wrenches in a box with no order, so I must sometimes consider numbers to orientate myself. Again, what puzzles me is why paying the effort to convert sizes into multiples of 1/2, 1/4, 1/8, 1/16, 1/32 and 1/64, when expressing all sizes as multiples of 1/64" would require no effort and simplify people life too.

Interesting, I did not know that.

By the way, in Italy we have a translation for the English word "dozen", that is "dozzina". But we only use it to buy eggs! For everything else we use the word "decina" (that means about ten items).

Who knows whether all such residues of the past will disappear in the next 100 years.

Yes, it's a nice system. Incidentally, a "spanner" in the US doesn't seem to mean the same thing that it does in the UK... here it is a specific kind of wrench used for retaining rings. I don't know how the usage got to be different.

>In the US, instead of always expressing size as multiples of 1/64" (that is

>spanner before taking a 1/2" spanner.

The average American probably can't, but technicians working with the US system pretty quickly get used to fractional numbers. We probably get a lot more practice dealing with fractions than you guys do.

Where it gets weird is when you get to very small and very large sizes, the systems sometimes change. For example, the hex wrenches go down to 1/8", 3/32", 5/64", and 1/16" but then the next one down is 0.050", then 0.035", and then 0.028". Damned if I know why.

And don't even get me STARTED on numbered and lettered drill bits.

I bought it last year and restored it because my Elmer had one during the early '50's and it always seemed the thing to have. I enjoyed the restoration process (skiped the caps in the one RF section) and alignment and had it working fine. Then the 5Z3 rectifier lit up brightly a couple of times upon turn-on and then later, it blew a fuse.

>I recapped an SX-28 and did the usual cleanup etc and then realigned it wi=
th care. All the voltages were within 10 to 15% and it worked well for a fe=
w months. Then the 5Z3 rectifier lit up with a flash twice after it had bee=
n off for a couple of weeks. Then while operating it blew a fuse. At that p=
oint I replaced the fuse and it blew immediatly. I then used a Variac and a=
mpmeter and noted it would draw an amp with only 5 to10 volts on the transf=
ormer primary.

> I unhooked the caps on the line side, pulled the rectifier and jumper plu=
g in the rear to isolate the transformer and it will still draw an ampere w=
ith only 5 volts on the primary. The line cord is not shorted and the prima=
ry is not shorted to ground and it does measure low resistance (a couple o=
f ohms) end to end which seems normal.
>
> It appears the HV secondary is shorted - it measures 19 ohms to CT on one=
 side and 16 ohms on the other to CT and 3 ohms end to end. No shorts to gr=
ound.
>
> I have a parts SX-42. Do you know if there are any problems in using the =
power transformer from the SX-42 in the SX-28? They measure physically abou=
t the same and the schematics are the same but I don't know about the power=
 capabilities. Do you have the transformer numbering for T7 or the SX-28? A=
ny advice on the substitution?
>
> Thanks for the help and guidance.

Not a lot of help maybe, but when my SX-28A mains transformer burned out I
had Danbury Electronics here in the UK make a replica, and they did a nice
job, incorporating the 115/230 volt switch and top cover onto their own
laminations and core. Cost was 100 GB pounds, not cheap but the RX is worth
it. I tried two transformers from two junker RXs before going to Danbury,
wish I'd saved the hassle as I found the two transformers in the junkers had
faults too. Danbury reported that the wax in the original had basically
turned to a sort of dust, they believed that the wax was organic, not
mineral.

I bought it last year and restored it because my Elmer had one during
the early '50's and it always seemed the thing to have. I enjoyed the
restoration process (skiped the caps in the one RF section) and
alignment and had it working fine. Then the 5Z3 rectifier lit up
brightly a couple of times upon turn-on and then later, it blew a
fuse.
>I recapped an SX-28 and did the usual cleanup etc and then realigned it
>with care. All the voltages were within 10 to 15% and it worked well for a
>few months. Then the 5Z3 rectifier lit up with a flash twice after it had
>been off for a couple of weeks. Then while operating it blew a fuse. At
>that point I replaced the fuse and it blew immediatly. I then used a Variac
>and ampmeter and noted it would draw an amp with only 5 to10 volts on the
>transformer primary.

> I unhooked the caps on the line side, pulled the rectifier and jumper plug
> in the rear to isolate the transformer and it will still draw an ampere
> with only 5 volts on the primary. The line cord is not shorted and the
> primary is not shorted to ground and it does measure low resistance (a

All,
I know it is OT and Menning will chastise me, but here goes. I need a
repairman that replaces the head wire on old fans. By head wire I mean
the wire that runs from the base to the motor housing on old fans.
After 70 years or so, this wire starts to decay and if the fan is set
to oscillate, the wire will fray sooner. Replacing this wire requires
the motor housing to be opened up and therein lies the hitch. These
motor housings were machine-pressed together and it is a task beyond
my abilities to open them I have several fans that need this work

done. Does anyone have a repairman who is able to do this that they
can hook me up with? Any help would be greatly appreciated.
rgds,
Mark S.

I've done this - you don't need a specialist, it's not hard. remove the
screws holding the motor halves together - if you can't just pull them apart
(which is what I find I can do much of the time), a tap on the hub with a
soft mallet will almost always separate them. If that doesn't work, cut a
piece of wood to remove an approximate circle of the right diameter, split
the wood into two halves and clamp it onto one half of the housing - then
while holding the other half, tap the wood with your mallet.

Does anyone know of a source of the AC line rocker switch used on the
Collins 30L-1?  It is S2 on the schematic, DPST Collins part #
266-6020-00.  Any idea who manufactured it and their part number?

Hi K6LTS:

I recommend you try the following. Surely, one or more should be able to point you in the right direction.

Collins Amateur Radio Club
http://www.w0cxx.us/

Collins Collectors Association
http://www.collinsradio.org/html/kwm40th.html

Surplus Sales of Nebraska
http://www.surplussales.com/collins/coll30l-1.html

The above purchased most of the available (original) components from Collins. They're not exactly the cheap kids on the block... however, all of the parts are new / original.

Good luck with the linear... one of my favorites. ;)

Hi,

I have a 1973 edition 30L-1 manual, and Collins included vendor
ID numbers next to many items in the Group Assembly parts list.
Switch S2 was made by Mc Gill Mfg Co.
907 N. Lafayette St.
Valparaiso, IN 46383

Vendor P/N C811-113010109

Please let us know if they are still in business.
That "C" in the part number may mean it was special-ordered
by Collins.

73,
Ed Knobloch

I'm the proud owner of a wonderful 390A, so far it is working as it should
but yesterday evening I have noticed no signals, noise, static, etc.at all
on the 3 mcs band!
Made a quick investigation, it seems that everything is working including
local oscillator, etc.
I'm interested in any initial trou bleshooting ideas folks may have.
Thanks in advance for any help!

There are two local oscillators. Have you checked both? It's only running double-conversion on the 3mc band so the 17mc oscillator isn't switched in for that band.

Hi,

The 0862-1111 series would probably look better on the 30L-1,
since it has a black rocker switch:
http://www.mcgillelectrical.com/CatalogProducts.asp?nProductsID=161

73,
Ed

We're trying to troubleshoot an ancient power supply for a high pressure mercury arc lamp. Theres a SOLA transformer that feeds into a rectifier stack and then two large filter caps. The output from the filter caps is only 60 vdc while they are rated for 150 wvdc. Every SOLA I've seen had a 115 vac regulated output. Theres no specs except for the SOLA part number "21-877". Do they all output 115 vac or were there lower voltage models? My guess is that the oil capacitor has gone bad and its no longer regulating correctly. Any thoughts?

Sola transformers were made for all sorts of output voltages. The caps do go bad which changes the volage at the output and can prevent the transformer from regulating. I also have a couple of old Sola's which do not regulate at the correct voltage despite new caps of the right value. I

have never been able to find out what causes this.
Note that the capacitors must be non-polarized types.

Could be, stick it on a bridge and see. Is it leaking?

It may not have a 115vac regulated output. Some of the Sola
transformers were step-up or step-down. A call to Sola should identify

the part number. I have seen some with 24VAC secondaries.

Is the thing rated for 60cycle use? A 50 cycle ferroresonant transformer
will go berserk on 60 cycle power.

Most probably load. These things MUST be loaded to half the rated
maximum load for proper regulation.

>   Note that the capacitors must be non-polarized types.

Film caps are recommended.

Not physically :) Tomorrow I'll do some testing.

I tried calling them but the guy basically laughed and told me good
luck. My understanding is its the Sola name but owned by a different
company. I tried searching to see if anyone had scans of an old catalog
but no luck.

>

Its definitely 60 cycle. The supply runs a "super pressure" mercury arc
lamp for an optical comparator. Up until yesterday its had regular use

for years but now the lamp will not sustain an arc. The only problem
that stands out is seeing 60 volts on the caps rated for 150. Thanks for
the quick reply.

Adam

These don't regulate at the correct voltage regardless
of load. My good Sola's have just about the specified
voltage open circuit.

Get the data sheet for the arc lamp itself and see what voltages it is
supposed to have for starting and running. Then work back from there.

If I saw a low voltage on the supply filter caps I would check the
rectifiers before anything else.

It appears to me that OP seems to think that BECAUSE the caps are rated
for 150WVDC that 60V is "abnormal". 150% over-rate on caps is not even
noteworthy.

Hiya, I'm moving my '88 from a rack into an (original) desktop
cabinet. My question has to do with the mounting bolts that screw into
the underside of the cabinet. Does anyone know what size they should
be? 5/16 is too small while 3/8 is too big, likewise 8 and 9 mm
respectivley. I do seem to recall hearing somewhere that the bolts are
11/32 x 20NC.

Any thoughts?

Kevin

Yeah I know, heat buildup in the cabinet etc, etc; but I need the rack
space.

That's the foot of the AVC chain and surely 3-4 Volts is *much* too low. I get 27-30, which would be expected with a total current of 110 mA and a total AVC chain of 275 Ohms.

There is no pot R46. Do you mean RV3. Which do you mean by 'pin 3'

Cheers

The designations are different on the US and UK versions
of the schematic. RV-3 and R-46 are the same, i.e., the RF
gain pot. The voltage table specifies measuring to the pot
but fails to say which contact. Since the pot is variable

(doh) that makes a difference. There is a US version of the
schematic at BAMA which will show the differences in
component lables. I still can't see how the AVC bus could
become positive unless there is something shorting it to the
B+ (HT) or else you are measuring to the wrong reference.

No, the AVC is definitely is NOT negative with reference to the chassis, but
the EMER773 states reference must be to the slider of RV3, where is should
be -1.2v. That is the reading that used to be OK and now is not. And I've
checked and rechecked aagain all the changes I made.

I found somewhere on the web a manual for the CR-88. I no longer remember where but I suspect you can find it. If not I can send via e-mail, its about 3Mb. It has a different voltage chart. All voltages are measured to ground. For instance, using a VTVM the voltage at pin 4 of the first RF tube is -18 volts with the RF gain control at minimum and -2 volts wtih the control at maximum. I can't understand measuring to the slider of the RF gain pot because the voltage there will depend on the position of the pot. I suspect this is an error of some sort.

Note that the whole RF gain/AVC sytem gets a negative voltage from a devider string in the center tap return of the power transformer. That is, the RF gain control is at a negative potential with regard to ground on both sides.

Actually, there are two strings from the center tap, one consists of R-46 (RV-3) and a 6800 ohm resistor called

R-55 on the CR-88 schematic. The other string consists of R-43, 44, 45 and the taps supply a fixed negative bias to the audio driver tube and audio output tube. If you are not getting a negative voltage on the grids of these tubes its a good indication that something is pulling this point positive. Almost the only thing there is the first filter cap which returns to the the top of the negative voltage deviders rather than to ground. If this is the case you will also see a positive voltage at both sides (and the slider) of the RF gain control. The lines from all of the negative supply points to their respective grids have rather high value resistors in them so I think its unlikely that something on that side could pull the entire chain positive. If you replaced the first filter cap check its wiring and check to see that it isn't presenting a low resistance path from positive to the devider chain.

Hello Alan, Richard and Colin.

Alan, yes, i've done a tenfold error !

Take in good advice what Richard say, about the AVC bus,
he's absolutely correct, *if you are shure of wiring redone*.

The Richard's subsequent reply is *perfect* to pin down the
error(s) or defective component(s), and also the Colin's
reply is of great help.

I can't add anything to those replies.

Good debugging,
cheers, Piero.

Yaesu released a new mobile VHF/UHF radio at the Tokyo Ham Fair last weekend, the
FTM-350.
The FTM-350 is a 2m/70cm rig, capable of putting out 50W max. GPS and APRS are
included in the box.

More info and images can be found on

Richard noted:

"Almost the only thing there is the first filter cap which returns to the
the top of the negative voltage deviders rather than to ground."

If that filter cap is a can, it would be insulated from ground, but it would
be easy to connect to ground when replacing, rather than the top of the
negative dividers.

73, Colin K7FM

I need informations about how obtain the manual for the transmitter
Bendix CRR-52253 (ATD).
Anybody has any informations about power supply conversion? Or any
about HV and LV in connectors?

Thank you.

Then come back and tell us about it in forty years, when at least it will
resemble a boatanchor in being old and obsolete.

Of course, it still won't be a boatanchor, since it it isn't big and
bulky, and made with tubes.

```

> respective grids have rather high value resistors in them so I think its unlikely that something on that side could pull the entire chain positive. If you replaced the first filter cap check its wiring and check to see that it isn't presenting a low resistance path from positive to the devider chain.

OK, time to bring a few things together, I feel, especially as I introduced a massive red herring in the first comment that I've reproduced in this thread...

I meant of course that the AVC was not *positive* with respect to chassis, as indeed it shouldn't be. Measurements taken from chassis are OK for the negative grid bias that must exist. I've just measured and if the RF gain is at minimum I get minus 18.5 volts on the grid of V1 (pin4) and if the RF gain is at maximum I get minus 3 volts (using a DVM, so impedance similar to VTVM). All pretty much in line with Richard's figures for the CR88. BTW I also get minus 0.8 on the grid of V10 (1st AF) and minus 17 on the grid of V11 (output). The grid voltages are all the result of the chain R43, R44, R45, as has been said.

The problem is rather more subtle. You really need to download the document EMER 773 from the VMARS website to understand it, but I'll quote the relevant bits. There is a list of test resistances and voltages round each valve on page 4 and 5. The relevant part is the grid voltage for valves 1, 2, 5, 6 (AVC line) (and incidentally the anode and cathode of v8, with the AVC off (ie V8b shorted), *against the slider of RV3*. Now, I quote, 'RF gain set to full gain'. That is why the measurement to the slider does not depend on its setting -- or rather the setting is specifed.... 'full gain'. The desired voltage is specified as minus 1.2 volts and is what I originally got and do not get now. Looking at the circuit, it can be seen that this measurement must be a result of the voltage drop across R42 (390K) and that can only be the result of a current flow (about 3 microamps). I first queried why there should be *any* flow as there should not be grid current, but someone kindly pointed out that there is a path to earth via R47 (2.2 Meg), RV1 (66K) and R49 (33K). I still can't make sense of this using Ohms Law (requires more volts than would exist at this point?), but it appears that the test to the Anode and Cathode of V8b is to verify all those resistors as well as the main AVC chain, plus the operation of the shorting part of the AVC switch. Testing minus 1.2 volts on the other grids also tests for continuity of the AVC chain and incidentally, if any valve was gassy there would be grid current and different readings just for that valve as the current would cause a drop on eg R2 (2.2 Meg). Incidentally, the filter caps (4 mfd) C96, 97, 98 don't come into this. I have not touched them. The caps I have replaced are the tubs.

Summarizing: Normal grid bias apparently OK. Specified reading to slider (as fixed posotion) WAS OK (so not a mistake in the manual*) but now not. A final bizarre possibility exists. Suppose the manual WAS in error and the reason why I got the origina readings was a compensating error in that the tabbed capacitors were leaky? Then I replaced them with good ones and now the error in the manual showed up! That would explain why the application of Ohms Law to the relevant part of the circut does not produce the quoted desired results either!

I think I'll have another coffee now...

I've had a very civilised email exchange with the owner of the website mentioned and he has apologised. I've blocked the other bloke (trader?) who was continually advertising stuff. Occasionally is of course OK

Hello,

Sombody know what size of hex wrench i need to remove the tone control
knob.
Smallest i have 1/16" but this is still to big.

Thanks in advance

Mario

I'm looking for a HF linear "fixer upper" or partially-finished project. Something on the order of 200-300 watts out, coverage on at least 80, 40 and 20. Prefer homebrew over commercial.

Not interested in sweep-tube amps, amps named after birds ("Eagle", "Falcon", "Raptor", and so on) or amps using tubes that I'd have to sell my car to replace. Tubes such as 813, 811A, 4-125 -- you get the picture.

Maybe you got some parts together for a homebrew amp but then found a good deal on a commercial one and the parts are sitting on your shelf gathering dust.

Or perhaps you built an amp but never got it going or lost interest in completing it for some reason.

I have some limited trading stock (tell me what you're looking for) or cash.

Jeff

Hi, Mario

It is a 3/64" hex wrench on my HRO-50,
I assume unchanged on your HRO-60.

I am interested in building a copy of the
Heathkit HW29A transceiver but I need further
information.
I have a good copy of the schematic, but I need
a copy of the mechanical layouts of the chassis, etc.
I cannot afford the astronomical price for the full manual.
Can anyone please help?
Any assistance will be greatly appreciated.

Duncan G4DFV

Time to do some cleaning.

power supply for RBA, RBB, or RBC receivers (CBOG-20130-C),
nice irginal condition including power cord  $150
```

Dual Diversity FSK receiving converter CV-31/TRA-7 aka model FRF,
this is an impressive converter...takes IF out from two receivers (455 KC)
and converts it to DC loop current to drive a TTY, dirty but will
clean up, including manual, $100

Hallicrafter R-44 receiver, this is an HF multi band aircraft receiver,
very dirty on the outside but very restorable and complete $40

Hallicrafters S-29 receiver, dirty but complete (except 1 knob),
dial plastic good $25

OS-8A 'scope, mint condition with case, power cord and manual
for OS-8C/E $75

Dynamotors;

BD-77KM and BD-86-B both are 14 volt input and I believe they
are for a transmitter (600 volts out), need cleaning may be NOS
$75 each

Everything is untested as-is. Pick up ONLY in Santa Rosa, CA.
Cash or may consider swap for a solid state HF rig in good
working condition.

Steve

Need a grey knob for a Knight R-195 receiver. Black seems pretty common
but this one wants grey. Only need one.

http://www.sparkbench.com/xknightknobs.jpg

Any war stories or tips on this radio are also welcome.

Thanks,
Bill WX4A

I am in the middle of repairing an old Waters 334 dummy load wattmeter for a local ham. He had picked this up at a hamfest and the meter didnt work. I have removed the oil tank and cut an opening in the back to access the internal components. The oil has been drained into jars and I will put the oil back after I make the repairs.

Ok, here is the question.

The failure is the diode. it looks to have the original diode. Black glass marked SG5409. I do not see a modern cross or the exact type still available. Is there a better or more durable RF diode that will work in this circuit? Temporarily, I soldered in a 1N4148 and this seems to work well at the 100 watt level. My concern is at a KW will this hold up? What about the possibility of stringing several 1N4148's in series to increase the voltage capability? I know that most of the power is going into the 50 ohm resistor and the diode is just seeing a small sample. The diode is in series with four 2.7 ohm resistors and then has a 15K fixed and a 10K pot before it gets to the meter. This is on the 1KW position. Any suggestions will be appreciated.

73, Randy, w5kcm

I've had a pleasant e-mail conversation with Eric/LA5KI and he has
generously allowed me to use his images on my site (link below). Eric
has a great collection on his www.qsl.net site.
Today I have uploaded new images for both Collins and Hammarlund models,
and I will add more images in the next few days.

Although this is a great addition to my site, it is far from complete. I
am always looking for new info and images. Any help in this department
is greatly appreciated!

73, Elmer/PH5E

1KW into a 50 ohm load is.... P=V^2/R... 224 volts.

Pick the fastest diode you have in the junk box with a breakdown voltage
of 250V or higher. A 1N4007 is probably not fast enough. One of the
high tech HexFREDs pulled out of an electronics fluorescent light
ballasts might be great. You don't care about current.

This is assuming you're measuring directly off the load, of course. If
there is a step-down transformer, you'll need even less voltage.

I have a 32S-1 that has been sitting for about 30 years, turned on occasionally in hopes of keeping the capacitors happy but never set to actually transmit. The PA plate current was a bit high (perhaps 70ma) so I adjusted the bias; maybe this was a mistake. When I tried to tune it up there was no signal.

The BFO, VFO, and HF crystal oscillators were on frequency and most of the voltages I checked seemed reasonable. The tone oscillator, however, was not... oscillating. The tube (V11B) appeared to be conducting, pulling down the plate voltage. I tried a different tube still in the socket extender and it worked; however, it did not work with the extender removed. I suspect the cathode bypass capacitor (C6B). I put the extender back for the time being.

With the tone oscillator oscillating the exciter tuning was giving me a nice response on the PA grid current and I was getting > 100W into a dummy load. Unfortunately I got a little carried away and probably spent too much time tweaking the response. There was a blue flash and the line fuse opened. With the fuse replaced I still get output but the PA grid current is weird. It may go negative or it may go off the scale (seemingly randomly) when I switch to tune. It doesn't seem to depend strongly on the exciter tuning. I'm thinking I overheated one or both of the PA tubes and some element warped and shorted.

If nothing is obvious on visual inspection of the PA tubes would it be reasonable to try with one at a time removed?

Dan,
The first thing to do is go through and tighten all the screws on the
chassis. Many ground connections rely on the screws and lockwashers for
their integrity.

Would anyone have any documentation on this Digital Display Unit?

Can you tell me what Radio(s) it is for?

The Power connector isn't marked. Can anyone tell me what power it takes and how the polarity lines up with the Two Socket Plug. (There is a key between the two sockets.

Much like

O u O

Any Help or Documentation would be GREATLY APPRECIATED!!!!

S.

Nope, but if you plug a signal generator into it, you should be able to
get it to start displaying something.  Work out the difference between
the signal generator input and the display, and then you'll know what
radios you can use it with.

Dunno, look at the power supply capacitors.  Try giving it an input voltage
around half of what they are rated for, then try cranking it up a little
bit until you get a stable display.  If there's a 7805 or something in
there, you can probably make a good guess about what voltage range it will
work with.

Have recently purchased a SP-600 JX-17 in "working/as is" condition.
the good.....it works on the lower 3 band ranges. The bad, it is "as
is" aka nothing (no signals, nouise, static, etc) at all on the higher
3 band ranges. Am interested in any initial troubleshooting ideas
folks may have. Thanks in advance for the assistance - winter is
coming and I'll need the tube heat!

The problem is that the second conversion stage is not working for some reason. The first thing to look at is the position of the IFO switch on the front panel, this is the left hand red knob. If its in EXT the set will not work on the top three bands.

The JX-17 version of the SP-600 differs little from other models but some of the differences are important. This receiver was meant to operate in groups of two or three in space diversity systems. This is simply a way of improving radio circuit performance by combining the signals from two or three spaced antennas since the signal variation due to certain kinds of fading will be different for each. Diversity combiners may need to have access to various internal signals from the receivers connected to them. The SP-600-JX was designed to fit these needs and obviate the need to modify the standard models. To operate as a stand-alone receiver the HFO switch must be set at VAR, and the IFO and BFO/AVC switches set for internal.

There is a great deal of information available for the SP-600 on the web. Complete handbooks and military repair manuals can be found. See for instance: http://www.jamminpower.com and of course the BAMA site: http://bama.sbc.edu/   For the last use the alternative site for downloading, its very much faster.

Also see: http://www.hammarlund.info/

The SP-600 is a very fine receiver. I have come to the conclusion that there are a great many of them which "work" but are really pretty sick. While they are fairly easy to work on (other than being very heavy) one needs some special knowledge to get them up to their capability.

A word of caution: NEVER BEND TUNING CAPACITOR PLATES they should be straight and parallel. If the frequench calibration is off it _can_ be from a misalignment of the capacitor stators and rotors but this is NEVER cured by plate bending.

Many SP-600s were made using the notorious Sprague Black Beauty capacitors. While these were made and sold to be extra-reliable high performance units they had manufacturing problems and proved to be very unreliable. It is common practice to replace _all_ of them (I think its 48) in the

receiver. Many military radios will have modified with
ceramic caps which are very reliable and long lived.
    There are a lot of SP-600 fans here so I think you will
be able to get answers to most of your questions.

There are three RCA jacks in the back for the input.. They are labeled
H C V

Not sure what kind of signal that would take... I did find an old post
of a question that read:

http://forums.qrz.com/archive/index.php/t-173825.html

7US
08-25-2008, 02:06 AM
I have a Kenwood TS-820 with a Grand GD-6K aftermarket digital readout.
One of the wires came loose from the plug in to the eight pin remote
socket. It is the wire marked "C" on the back of the unit. Can anyone
helpme figure out where that wire goes? I got the rtadio used some years
ago, and there are no instructions.
Thanks

KK7US, Lee

This is the only reference to the counter that I have found. Don't know
if that helps any..

???

Thanks

I'm going to take a very wild guess and say Heterodyne Oscillator,
Carrier Oscillator and VFO.

As to how to access those points in the radio I haven't a clue.

I have a problem with strong stations imaging under adjacent stations.
For example, China on 5950 also shows up under a station at 5985 and
one at 5935. Also a strong station on 9985 will also show up under WWV
on 10mHz. The images always seem to show up under adjacent stations,
never on their own. Can anyone suggest what may be wrong or out of
alignment with this radio? Thanks!

Hi:

That sounds like a cross-modulation problem, rather than images. Images would appear 910 kHz away.

Cross-modulation would occur in the rf stages or in the first mixer. To determine if that is the problem, reduce the signal strength and the cross-modulation will go away.

The SX-28 should not be cross-modulating under those conditions and should be able to handle fairly strong signals. Often, the culprit is that someone has modified the set for "improved sensitivity", in which case, they made changes to make the S-meter read higher. Frequently, this involves changing rf amplifier tubes from remote cutoff types to sharp cutoff types, or changing resistors or bias voltages.

Check the circuit to make sure it is stock. Also, check the caps and resistors in all of the circuits, especially in the rf, mixer and avc circuits.

Also, realignment of the rf stages may help, especially if the tuned circuits amplify the offending signal more than the desired one.

Hi all,

I'm trying to dig up some information about the Marconi company. I've

got a few rigs listed on my site made by this firm, but I can't seem to
find exactly what company it is. Problem is that when I search for
'Marconi' I obviously get a lot of results.

Can anyone tell me if the Marconi company that build the Atalanta, CR100
and Mercury receivers is in fact the same company founded by the Italian
Guglielmo Marconi? Personally I very much doubt this, but I have nothing
to back me up. Any help very much appreciated!

The Marconi rigs on my site can be found here:

I think checking the tube types is a very good idea. If someone replaced the originals with later high gain types it may be the cause. These tubes look attractive because they have lower noise and higher gain than the originals but do not work well in circuits not designed for them. The SX-28 uses a 6SK7 in both RF stages. The later but similar SX-32 uses a 6AB6 in the first RF position. This was a remote cut-off tube designed for TV RF and IF use and has much higher gain than the 6SK7. Another possible tube is the 6SG7, also a high transconductance tube, similar in performance to the 6BA6 miniature tube. This one was used in the S-40 series. Someone may have been inspired to stick one of these guys in. Beside the higher gain these tubes require a different bias voltage so the AVC won't work right.

Actually, there are other tubes which can cause even more trouble such as the 6AC7, a very high transconductance sharp cut-off pentode meant for video amplifier use. A tube like this will tend to cause the AVC to operate at a slight AVC bias which will cause overloading in the other controlled tubes. Even a 6SJ7 in the first RF stage will cause this trouble.

     In fact it is the vary same although its been through
some business changes. See the article on Wikipedia for a
brief history: http://en.wikipedia.org/wiki/Marconi_Company
     Marconi, unlike many inventors, was a very good
business man and created a very successful company which
still exists. The US part of Marconi was sold to GE/RCA when
RCA was formed in 1919 but continued to operate in the rest
of the world.

tari!

The fuel coming from?

I think Colin has the idea! Use one of the WWII British steam radios
that were used in the south-west Pacific. They were 'powered' by the
camp fire.

Am I correct in thinking that the sets intended to be 'crank powered'
used mostly direct heated [battery] tubes and those fast heating
direct power tubes that looked like a metal 6L6? One would think that
the design would minimize the waste power, simply because of the
limited output of the [human] power source.

Neil S.

Hi,

The thing about an EMP device is that it is meant to be detonated
at a very high altitude, so there is no radiation poisoning
on the ground.  Since the device doesn't directly cause loss
of human life, the attacked country has a quandry
whether or not to launch a "mutual assured destruction" response.

A lot of the large power plant a.c. generators would be knocked out,
because they use "brushless exciters" for the rotor.
The rotor is excited by a small separately controlled a.c. field,
and uses large semiconductor diodes
that spin along with it, to create the needed d.c. within the rotor
windings.

73,
Ed Knobloch

Does anyone know if the S20R had to have jumpers on the acc jack on the

back. My recent find at the local swap meet does not have
voltage on the tube fils and if was a easy jumper I would do that rather
then tear it apart. Bob K7MXE   k7mxe@yahoo.com

Yes. The octal socket on the back is designed to allow the radio to be
operated from a vibrator power pack, and for AC operation a plug with
one or possibly two jumpers is required. Unfortunately I don't have the
information on which pins need to be jumped handy -- I'm sure someone
will come up with that information.

"I think" that if your sales post serves this group in support of this hobby as apposed to making a killing then I welcome it. There have been many posters with gear or specialty parts that I have purchased. I also have collected old gear like RF gens for free to pass on to others that I entice into the hobby.

I think properly labeled in the subject line, briefly worded with a decently fair posted price is respectable.

BTW - My 17 year old son, out of summer school, was looking to avoiding working at KFC. His alternative is pushing a mower (1 job) and with me in the shop/shack. Today, he spent his first 4 hour politely listening to me while taking apart, looking up schematics and testing tubes on his very first restoration Emerson 695 AA5 clock radio!!!! I have two presentations to Elmer Hams on radio restoration with steps to follow. http://www.ppinyot.com/S/slides.htm It helps greatly if he can read something and follow with me coaching.......

I told him whatever he "restores" (we don't fix radios here) found in the garage he can sell and keep the money. He is already scheduling me to Kutztown this fall. Unfortunately, we have a wedding to attend.

Wish us luck, pray for us.
I hope it lasts :~)

> Just a lurker here, really and would like to maybe expand on the recent discussion about FS and WTB type posts a bit.
>
> I have visited this group on and off for a few years and not participated mostly due to having little of substance to contribute. I used to have a bunch of BA gear, but time and space have kept me from doing anything with any of the stuff I do still have. As such, I found my way back here looking to maybe divest myself of most of the stuff that I still have. I love this old stuff, but realize that I just won't likely have the time or space to ever do much with most of it. I bothers me to have it sit unused here when there are likely folks who would use and appreciate the stuff. Much of it has gone unused for years now, and I realize that it is not likely to get used any time soon.

FWIW I scanned an original 1945 manual which is now on BAMA. This is a high resolution scan and a rather large PDF file. It has a hi-res schematic. This is essentially the same hanbook found elsewhere but the scan is better and its complete. I will probably add restringing info since that seems to be hard to get. Several folks helped me out when I needed that info but I must make a clean diagram.

I have both the BAMA and Nostagiaair versions of the SX-62a.  The BAMA is
almost impossible to read.  The Riders (both Nostalgia air and the CD
version) is the wrong model.  The 62A only has one loctail.

I am straining to read the values.

Please if some one has a nice clear copy I would really appreciate a copy.

Currently Under restoration. http://www.ppinyot.com/sx62a.htm.  Man! There
are a lot of .02 uf caps in there.

Thanks in advance,
Paul P.

Help I spun a coil in a PACE (Pathcom) CB-76 Tranceiver (receives fine no
transmit)
Darn got the receive working then lost the transmit oscillator or mixer
(dried up paper coil)---- I barley put any torque on it.

Need a copy of the XTAL synthesizer circuit to repair the coil, the windings
are intact.   This radio appears in the Sams CB50.
The coil is an has 3 terminals im guessing
1-Winding one = 2 turns --to base of transistor
2-Common ?
3-Winding two = 30 turns -- to wiper on xtal selector
So far no good

I found this on another forum. All I can say is WOW!!!!!

Thanks to the guys that put all of this information together.

Perry Sandeen has finalized a remarkable work on the Hammarlund SP-600 and its many variants. This has been a long process with input from many different people who all had something to share on this fine receiver.

It is available for download (free) on the Hammarlund Historian website. It is in .pdf format and in two parts, each being approximately 7 megs.

Look here: http://www.hammarlund.info/

Thank you for the tip. I am an SP-600 owner and fan. I will comment on this stuff later when I can download it on a machine on a high speed line. Here I am on dial up and these files will take forever.

There is a relatively large amount of material about the SP-600 on the web, probably second only to the R-390/A which seems to be the most thoroughly documented boatanchor of all time.

Downloaded these last night. While a lot of this information is available already its scattered all over the place so its quite valuable to have it gathered together. Some of the modifications are interesting but I don't think I will modify my RX. Remember, the SP-600 has an IF output plus outboard terminals for the AVC and detector so its possible to build all sorts of outboard auxilliary equipment.

I am also very skeptacle about modifying RF stages for low-noise tubes. The noise level of the receiver is already pretty low and for communication frequencies, at least up to 30mhz the antenna input noise is likely to be many times the front end noise plus the 6BA6 has excellent dynamic range. BTW, I disagree with Andy Moorer and some others who think the AVC system is poorly designed. Actually, its pretty good with increased "delay" to the RF stage to keep the noise level down. For those using the SP-600 mostly for broadcast listening its helpful to lengthen the AVC time constant considerably, this is easily done by hanging a capacitor across the AVC terminals on the back. Try about a 0.1 uf for starters. This will eliminate the low frequency intermodulation due to the AVC following low frequency modulation in the signal plus it will keep the signal strength meter from following the modulation.

I had an SP400 in the UK in the 1960's. I would to get one again, or info
about it...

Hi all

I've struck an infuriatingly obscure problem with my AR88 and the AVC line.
Are there any true experts here? If so, I'll post the details. Don't want
to bore you all otherwise!

I probably don't qualify as an expert but you have roused my curiosity to the breaking point! Please post the details. Those who are bored can just not look. (As in _Saving Private Ryan_ "Dont look! Don't look!").

> again, or info about it...

I have a lot of exprience with the earlier SP-200, 210, etc., series. I used a BC-779 as my station RX for a long time. The SP-400 is essentially the same as the 40mhz version of the 200 except that the frequency bands are wider than 2:1. The 20mhz and 40mhz limit receivers are nearly identical except that the RF stages in the higher frequency model are shunt fed instead of series fed. That results in slightly higher Q and slightly better RF selectivity.

I tried a lot of modifications in my RX but the only one worth doing was adding a voltage regulator to the LO.

The rack versions came with overall shields which fit over the entire chassis. These are not ventillated so the set run _very_ hot with them. I put mine in a table rack without the outer shield.

These are _very_ good receivers despite the old tubes in the RF and converter section. They are very well shielded so that there are very few spurs. Stability is adequate but there is no temperature compensation (despit the fact that Hammarlund used it in other receivers of the time) so you have to run it continuously if it is to sit still.

Mostly you will not have to deal with the tuning box. Its very complex and a bit of a Chinese puzzle. I have cleaned one but don't remember all the details. Avoid working on it unless there is a very good reason.

There are handbooks available on the web for nearly all versions of the Super-Pro.

        ^^^^^^^^^^
    Left out a whole sentence here:-(I meant to say
hopfully etc, plus that the last of the tribe is now over
sixty years old and will probably need a lot of recapping.

I have an early AR88 that developed a very elusive fault while I was
coincidentally changing some capacitors and resistors. Of course I suspected
I may have miswired something but I have checked and rechecked and it

doesn't seem so. May be just a coincidence.

This fault has defied many weeks of painstaking work. I wonder if members of the list have any ideas

On the excellent test table provided in EMER 773 (on the VMARS website), under the specified test conditions (including AVC off) there should be voltages of - 1.2 V on the grids of V1, V2, V5, V6 and the anode (plate) and cathode of V8b, taken to the slider of RV3 (RF gain) when at max. This is of course the AVC line, and for the voltage as shown to the slider of RV3 there must be 1.2v across resistor R42 (390K). Well those readings used to be obtained, but after my work they are very slightly positive! (I emphasise that the readings are not to chassis but to the slider of RV3 as instructed. looking at the circuit diagram, to get that voltage between those points, there must be a very small current flowing through R42. It would have to be as a result of voltage from the bias dropper chain of R45, R44, and R43. These have all been checked OK and there is approx -30 volts to chassis at the end of the chain (total HT/B current for the set 110mA). With v8b shorted (per EMER 773) the other end of R42 goes via R47 (2.2 Meg) RV1 (66K) and R39 (33K). All those have been checked OK but no volts across R42!

I have tried disconnecting the AVC main feed to V1 etc from SW22, but no difference so the problem is not in any of the circuitry before v8b.

Next problem (connected?) There is mild AVC action *whether the AVC switch is on or off*!

Any fresh ideas?

BTW, to get -1.2 volts across R42 (390 K) would require a very small current of .003 mA. How is that obtained if there's a chain through R42, R47, RV1, R49?

Wouldn't strain your mind with this, but you did ask! Cheers

I'll follow along the schematic and see if I have any ideas. RCA's schematics can be confusing:-(

Well I agree. Being a Pom, I used the Anlglicized version of the circuit which is on EMER772. I find the convention of having high voltage lines higher than low ones (and the negative AVC line below the chassis 0) easier to understand. The US diagram in the original handbook has the valves upside down to my mind (!) Having said that, I consider the AR88 (US design that it is) to have been decades ahead of any Pom effort (like the infamous 38 set!). 1940 or even earlier and it's still a beaut performer.

I got things mixed up and the Stancor info I am looking for is the DC3 and not the ST3. Low power mobile six volt job and looks like WW2 time frame but would surely like more info. Any old old timers out there. Bob K7MXE

The RCA schematics are sort of combination schematic

and wiring diagram with all the pins shown in actual order.
A lot of schematics for home radios were drawn like this.
Its confusing because there is no natural flow. My other
favorite is Western Electric transmitter diagrams with all
the filaments and ground wires shown so they look like a map
of a large freight yard.

BTW, I downloaded a bunch of stuff from the VMARS site,
lots of R-390 and other books there and a military handbook
on the older Super-Pro models.

I just acquired a Gonset G-63 receiver, but no manual. BAMA doesn't have it
unfortunately, and I haven't found any other download site that does.

If anyone could email me a scan of the schematic, I think I can manage it from there.

Any help would be very much appreciated.

Good site, isn't it! Now Richard, stop salivating over the R-390 stuff and
solve my problem with the AR88!

Further to that Peiro, there is no provision on either of my valve testers
to test diodes for gas!  I always understood that was a problem if there was
```

```
grid current but of course in a 6H6 there are no grids!

Also a gassy diode can make havoc in a very high impedance circuit like
the AVC of AR88 (note resistor's values !) .

If slightly ionized inside, the *reverse* resistance is much lower than
normal, as some positive ions are bombing 6H6's cathode.

Try exchanging it using the limiter tube, also a 6H6, and redo
measurements, if something different, try another 6H6.

Sometimes old *new* tubes need to be "formed" before use activating
residual getter inside applying filament only, for a very long time,
like 48 hours and after that some other time wth plate voltage on !

HTH,
Piero.

OK, nothing useful.

When you have restored the capacitors and resistors, substituted any
valve ? If so, check for a *slightly* gassy one !
(RF amplifiers, mixer, MF amplifiers)

Cleaned carefully where soldered new components ?

Capacitors are of the *best* type ? (low loss types).

Impedances are very high, a current of 3 *microAmp* is nothing with a
grid resistance of 100 KOhm, but with a 5 MOhm, became noticeable.

Wires are well insulated ? No cracks or degrading rubber ?

Cheers,
Piero.

*** Many new valves BUT I have disconnected the AVC line from V1,2,5,6 and
there is absolutely NO current flow across that gap or chnage in the wrond
voltage at V8, so I think we can rule out gassy valves?

OK, make some measures.

With a VTVM or other *high* impedance voltmeter, make a reading at
juncton between R43 and C97 (4uF) and chassis ground.

Must be approximately *minus* 3-4 volt.

Again, make a measure at junction between pot R46 pin 3 with R55 and
chassis.

Must be approximately *minus* 0,3-0,4 volt.

After done, post readings.

HTH,
   Piero.

Although I do not have a schematic of the AR-88, I just started reading the thread, so I thought I would jump in more to kick you into changing your detective methods than to hand you an answer (which I do not know)

If everything was ok before the surgery, and things are now bad, then something happened during the surgery. That is probably painstakingly obvious. But, it is important, because it probably rules out changes that might suddenly have occurred outside of your surgery - such as bad tubes.

So, the question is what happened during the surgery that could cause the problem. It could be a defective capacitor, or an electrolytic instlled backwards (especially in negative line). Or, it could be a wire from one of those components sticking through a terminal and shorting something. Or, it could be that a resistor got moved and broke in two pieces, but is not visible. It might be useful to do a resistance check if the manual has one, or check individual components. Another possibility is, when soldering to a pot, that the internal connection was broken by the movement of removing and reconnecting the wires. Same thing on power resistors, especially adjustable power resistors.
